The Power and the Glory

Vulcan internal hard drives are not only the fastest hard drives on the market, they're the most powerful. By a long shot. Vulcan's built-in power supply was custom-designed by Applied Engineering to provide the power other systems (and your unenhanced Apple II) lack.

Sheer, raw power

A typically enhanced Apple II system (with 3 or 4 expansion cards) needs a heavy duty power supply. Vulcan's power supply is rated at more than 70 watts. *Double* the capacity of other hard drives and double the native capacity of your Apple. The power supply components are heatsinked to the aluminum case, and to harness all that power, Vulcan incorporates an ultra-quiet, flush mounted cooling fan.

Unmatched speed

For speed, Vulcan incorporates an ultra-fast 16-bit data bus controller, not the less expensive 8-bit others use. The result? You'll load AppleWorks GS in less than 14 seconds. Boot GS/OS into the finder in 18 seconds. Verify disks at the astounding rate of more than 180 blocks per second. Vulcan wins any speed test.

Upgradeable Flexibility

Choose a Vulcan from 20, 40, 100 — all the way to a staggering 200 MEGs. Vulcan is upgradeable, so it grows as your needs grow. And we don't mean by daisy-chaining additional hard drives. When you upgrade Vulcan, you pop one out and *replace* it with another.

Use virtually any operating system: GS/OS (v5.0 is included), ProDOS 8, DOS 3.3, CP/M or Pascal 1.3. Vulcan supports them all with sixteen partitions (access four simultaneously). Choose slot 1, 2, 4, 5, 6 or 7. Even pseudo-slot to slot 7 from elsewhere. Vulcan works on 110/220 VAC, even European 115/230 VAC at 50-60 Hz.

Easy to use

Vulcan simply pops in; replacing the Apple power supply under your computer's hood. Our built-in firmware automatically installs itself as a Desk Accessory for write protection and partitioning. The software we provide lets you easily park heads, back up and reformat.

Vulcan gives your Apple IIGS, IIe, II+ or II an upgradeable combination of useable speed, safe

power (it's FCC certified) and practically unlimited size. It's a powerful and glorious advance into the Apple II future.

Order today!

To order or for more information, see your local dealer or call (214) 241-6060 today, 9 am to 11 pm, 7 days. Or send check or money order to Applied Engineering. MasterCard, VISA and C.O.D. welcome. Texas residents add 7% sales tax. Add \$10 outside U.S.A.

We turn Apple® Owners into Apple Users. For only \$6.65 a month.

Softdisk™ is a monthly two-disk collection of valuable software for your Apple® II, II+, IIc, IIe, or IIGs.

Learn from the Experts!

Draw on the vast experience of our software editors to provide for you each month carefully-selected programs which you can use productively...from spreadsheets to accounting programs, from role-playing games to recipe programs, from home office to telecommunications programs. Using clearly-written documentation, you will master each new application with ease and confidence.

Become Experienced Inexpensively!

Without your investing a fortune, **Softdisk** will quickly demonstrate to you the full power and versatility of your Apple II. With its wide range of software, you will learn more about the capabilities of your computer than you ever thought possible. At only \$6.65 a month, **Softdisk** is your best software value!

Try Softdisk for Three Months!

Each month the latest issue of **Softdisk** will be delivered to your door on two unprotected 5¼" disks or one 3½" disk. Each disk is filled with great software, including utilities, games, home and business applications, and educational programs. Order now and receive **Softdisk Premium Graphics, Vol. 4** absolutely free!

FREE!

Softdisk Premium Graphics, Vol. 4* when you place an order for the next three issues of **Softdisk** for your Apple II! Your bonus disk contains 200 graphic images, including:

- **Signs and Symbols**—Barber, Stop, Elevator...and more!
- **Animals**—Pig, Ram, Rhino, Dog, Cat, Buffalo...and more!
- **Sports**—Baseball, Basketball, Hockey, Olympic Events, and NBA Emblems...and more!
- **People**—Pilgrim, Cowboy, Hunter, Boy, Girl...and more!

Your Satisfaction Guaranteed!

If for any reason you are not satisfied with your purchase, return your first issue for a full \$19.95 refund. **Softdisk Premium Graphics, Vol. 4** is yours to keep. You just can't lose!

*Premium Graphics in 3½" format compatible only with Apple II GS.

Reviewers Love Softdisk!

"Boot the disk, and you're hooked! Every issue guarantees hours of adventure and fun. In a world where real bargains are hard to find, **Softdisk** is a very pleasant surprise..."

—Electronic Learning

Contents of Issue #89*

- **Asia**—Learn its countries and cities.
- **The Golden Cheese**—A treasure-filled maze to keep you mystified.
- **Finger Spell**—Learn to sign with the American Sign Language.
- **Expense Master**—Track your business expenses with this AppleWorks® template.
- **Tree**—Display the tree structure of your ProDOS® disk.
- **Print Shop® Graphics**—A new variety of images for your collection.

Plus ten more programs and features!

*Available as a back issue

Available at Waldenbooks, B. Dalton Booksellers, and fine bookstores everywhere at a cover price of \$9.95. ProDOS, AppleWorks, and Apple are trademarks of Apple Computer, Inc. Print Shop is a trademark of Broderbund Software.

YES!

Please rush my free **Softdisk Premium Graphics, Vol. 4*** and start my three-month subscription to **Softdisk** for my Apple II for only \$19.95 postage paid. I understand that this offer is a **trial subscription** and that I am under no obligation to continue beyond three months. *Canada/Mexico \$24.95 • Overseas \$27.95*

Dear Readers:

We'd like to hear from you!
Whether you have questions you need answered or you'd just like to share your thoughts on articles and issues, drop us a line.

Send your letters to: **Letters, Nibble, 52 Domino Drive, Concord, MA 01742.** (Letters may be edited for length.)

OBJECT LESSON

► I would like to join Henrique Avila Vianna (Letters, *Nibble*, Vol. 10/No. 7) in thanking and congratulating John Romero for his games; I would also like to thank Bob Gardner for his program Diskoverer (*Nibble*, Vol. 7/No. 8).

However, I am glad Diskoverer and Major Mayhem were published before Checkit came along. I say this not because I don't like Checkit (far from it) but because part of the fun, and most of the learning experience, of Major Mayhem and Diskoverer came from following the source code and being able to experiment and introduce changes. Because of this, I have yet to type in City Centurion (*Nibble*, Vol. 9/No. 12).

I was able to take advantage of Bob's foresight and add a command to Diskoverer; Major Mayhem taught me all I know about bit-mapped shapes. I don't own an assembler. I can type in the hex listing error-free the first time, but I have virtually no hope of understanding what I am typing. I would love to turn Works Processor (*Nibble*, Vol. 10/No. 3) into a SYS file, but this seems impossible for me. Please, please, revert to including the object code with the source-code listing! I am sure that owners of

assemblers will still be able to use the object code, and those of us who use CHECKIT will still be able to type in the hex dump. But we will all be able to follow the listing and learn from it.

Mike Beaumont
Auckland, New Zealand

To publish the object code next to the source code would take substantially more page space and, unfortunately, could force us to publish fewer or smaller programs. Most of our readers say a separate hex code listing is much easier to type into the system — particularly with Checkit to verify the process. We'll continue to consider the tradeoffs, but for the time being, it seems to us that we're best serving your interests by publishing the hex code as a separate listing.

And you can still use the Apple II's System Monitor to disassemble the code after you enter it; you can then send the disassembly to a printer for study.

REVIEW BOARD

76 **STORYBOOK LEARNING**

Learning can and should be fun. Your kids can't go wrong with The Ugly Duckling, Stone Soup, and Once Upon a Time... II. — by Lisa Maddox

Welcome to *Nibble* magazine, one of the most interesting and useful publications available for Apple owners. *Nibble* publishes an outstanding collection of valuable Applesoft BASIC and other applications that you can type and run right from the magazine. And every application is supported with an article that shows you, step-by-step, how to put the project into your Apple II and how it works — even if you know nothing about programming!

If you're new to computing, however, you may find the world of programs a bit confusing at first. If this is the case, perhaps the best advice would be to spend some time with the manuals that came with your computer. Once you understand how to get Applesoft BASIC up and running, you'll be surprised at how easy it is to enter programs into your Apple. It's always a good idea to start small, with a short BASIC program. Don't forget to review the Typing Tips in this issue as well.

THE BASICS...

Applesoft BASIC is built right into your Apple II. You can type in and run BASIC programs without using your disk drives at all, but if you want to save your programs for later use, you'll need to follow the instructions in your owner's manuals to get BASIC and the disk operating system up and running.

Once you do, you will most likely see a "J" character, called a *prompt*. When you see the prompt, your computer is waiting for you to tell it what to do next. You can:

- Type commands from the disk operating system (e.g., CATALOG)
- Type commands in BASIC (e.g., PRINT 36*42)
- Type in a BASIC program line (e.g., 10 INPUT NAMES,ADDR\$)

All BASIC programs consist of a sequence of numbered program lines. The program lines consist of a line number followed by one or more BASIC statements separated by colons. For example,

```
20 FOR I = 1 TO 5: PRINT CHR$(7):
   NEXT I
```

To enter a program, start with the first numbered program line and type it in — including the line number itself — exactly as it appears in the listing. Though a program line may span several printed lines in the listing, do not press Return (the Return key) until you have typed the entire program line. Repeat the process with the next program line, and continue until you have entered them all.

To enter the program in **Listing 1**, follow this sequence:

1. Make sure the Caps Lock key is down.
2. Type NEW and press Return to erase any

program lines that may already be in memory.

3. Type **line 10** exactly as it appears, pressing Return after typing the last word in the line ("BELL").
4. Repeat this process for **lines 20-30**
5. Type SAVE RINGER and press Return to save the program on disk under the name RINGER.
6. Type RUN and press Return to start the program. If you entered each line correctly, you should hear a bell ring five times.

LISTING 1

```
10 REM RING THE BELL
20 FOR I = 1 TO 5: PRINT
   CHR$(7): NEXT I
30 END
```

...AND BEYOND

In addition to BASIC, *Nibble* also publishes programs written in *machine language*, the Apple's own internal language. Machine language may at first be intimidating, but you do not need to know all about it in order to use it and harness its power and lightning-quick speed. *Nibble* articles have special instructions for entering and saving machine language programs.

Often, programmers use what is called an *assembler* to translate *assembly language* into machine language. Assembly language is slightly more English-like and readable than machine language, which appears to be nothing more than *hexadecimal* numbers, or *hex codes*. Hex codes are usually two-digit numbers, with the letters A through F included as digits (e.g., 01, 23, 5F, and EE are all valid hexadecimal numbers).

If you have an assembler, you can type in the assembly language (or *source code*) listings in an article. If you don't have an assembler, you can enter the machine code directly into your computer. Machine language listings have lines that consist of a three- or four-digit hex number followed by a colon and several two-digit hex codes separated by spaces. For example,

```
300:A2 05 20 DD FB CA F0 03
```

Listing 2 is a short example of a machine language program in a format that we publish in *Nibble*. The following step-by-step instructions show you how to load it into your Apple and run it.

1. From the "J" screen prompt, type CALL — 151 and press Return to switch into the System Monitor. You should now see a screen prompt, "***" (followed by the blinking cursor).
2. At the cursor, type
300:A2 05 20 DD FB CA F0 03
and press Return. Be sure to include the spaces between the pairs of hex characters. You have just entered the first line of the machine language program.
3. At the prompt, type the next line,
308:4C 02 03 60
and press Return. This is the second and last line of the machine language program.
4. Now press the Control and C keys together, followed by Return to go back to the familiar "J" prompt.
5. To save the machine language program as a *binary* disk file, type

```
BSAVE RINGER.BIN,A$300,L$C
```

The A\$300 is the hexadecimal address in memory where the program resides. It corresponds to the 300 that you used in the first line of the program. The L\$C specifies the length of the program, which contains 12 pairs of hexadecimal characters (\$C is the hexadecimal equivalent of 12).

LISTING 2

```
300:A2 05 20 DD FB CA F0 03
308:4C 02 03 60
```

To run the program, type CALL 768 and press Return. This causes your Apple to begin running the machine language program at memory location 768 (which is the decimal equivalent of \$300 hexadecimal). You should hear the bell ring five times each time you type CALL 768.

In this column, we have instructed you to press Return after typing a statement or a command. With the programs in the magazine, however, we do not include the Return instruction. Assume that you need to press Return at the end of each program line.

FIRST AID

To help you avoid typing mistakes, *Nibble* has developed the Checkit system, which alerts you of any typing mistakes you might make. The Typing Tips section explains Checkit and also has information about our Technical Support Department, which is devoted to helping you get your *Nibble* programs up and running.

ASK NIBBLE

by Roger Wagner

Where can you get answers to all your Apple questions?

Ask Nibble of course!
Send your questions to
Ask Nibble, 52 Domino
Dr., Concord, MA 01742.

Q Is there a way, from Applesoft BASIC, to load and save Double Hi-Res pictures?

A To understand the solution, let's first consider why there's a problem. Apple II computers with 128K or more of memory (Ile, IIC, IIGS, and Laser computers) have two banks of 64K memory. But Applesoft BASIC was created for the Apple II Plus, which had only one 64K bank. Because of this, Applesoft has direct access — with POKes, PEEKs, and CALLs — only to the first 64K bank.

A regular Hi-Res graphic screen corresponds to the chunk of memory from \$2000 to \$3FFF (or 8192 to 16383 in decimal). When you BLOAD a Hi-Res picture as a binary file, it is loaded into this block of memory, and the picture appears. Saving a picture is accomplished by BSAVEing the same range of memory to disk. So, a typical Applesoft graphics program might look like this:

```
0 REM REGULAR HI-RES PROGRAM
5 DS = CHR$ (4)
10 HGR
20 PRINT DS; "BLOADPICTURE1,AS2000,LS2000"
100 REM USER PROGRAM HERE THAT CREATES NEW SCREEN
200 REM SAVE NEW HI-RES SCREEN
210 PRINT DS; "BSAVE PICTURE2,AS2000,LS2000"
```

When the Apple IIe was created with 128K of memory, an additional 64K became available. This bank of memory technically has the same address range as the first 64K, and is parallel to the first. Applesoft doesn't have direct access to it, but parts of it are used in some Applesoft programs, notably in 80-column text and Double Hi-Res graphics. The 80-column text ability was created by changing the video display hardware to use each bank of memory alternately as characters are put on the screen.

So, on the 80-column screen, half the characters — the ones at VTAB positions 1, 3, 5, and so on — are stored in the second bank of memory (called the auxiliary bank). The characters at the even VTAB positions — 2, 4, 8, and so on — are stored in the first, or main bank.

Double Hi-Res (DHR) is accomplished by combining the banks of memory; it was discovered accidentally soon after Apple produced the first IIe machines. This technique required a small

PAYING THE BILLS

A new year! New challenges and opportunities... and risks. In the continuing discussion of starting and managing your own business, two of the most misunderstood concepts are **PROFIT** and **CASH**.

In simplest terms, profit is what is left over after all your revenues are received and all your bills are paid. Profit is the *bottom line*. Cash, on the other hand, is the currency that you must have to pay the bills. You can't build cash without profit, but profit by itself is not enough.

PROFIT... SUCCESS?

Let's examine some of the ways that entrepreneurs can be trapped by profit myopia. First, there are several levels of profit that must be considered. The most commonly understood is *gross profit* or *gross margin*.

Let's say that you've developed your own software product that you're selling through direct mail. It costs \$20 to produce the product, and you're selling it through the mail for \$49.95. You'll probably think in terms of a \$29.95 profit every time you sell one. And it's true that \$29.95 is gross profit. But wait.

If you sell to dealers, they'll expect a 40-50 percent discount from your price. This means that if you sell your product for \$49.95 to individuals, you'll get only \$25 from a dealer sale. Your gross profit on a dealer sales drops to \$5. Dealers will also insist on being able to return any unsold products after 6-12 months. But you can still book the initial sale as gross revenue and profit, realizing that there's a potential time-bomb ticking if returns are excessive. *A number of software companies were badly bruised by overstocking and heavy returns in the last holiday buying season.*

Remember, too, that all of the production costs are incurred up front, before you've shipped anything.

NETTING OUT

If you're an independent entrepreneur, it's tempting to conclude that you're making \$29.95 on every individual sale and \$5 on dealer sales. That's a dangerous place to stop.

Did you have to advertise the product to sell it? That costs money. Did you mail it to the buyer? That costs money too. Was the order processed using paper, forms, invoices, etc.? The supplies cost money. Was your computer used to do the processing? That's capital that was used in your business.

What about labor? Advertising costs? Supplies? Rent? Heat and light? All of those things cost money. All of them subtract more money from your sale and reduce gross profit.

Initially, it's easy to assign no value to these things, since many of you will start your businesses in your own homes. You may say: "Well, my spouse and I do all the work, so that doesn't count!" Well, with all respect... that's baloney. Remember, you're starting a business.

The simple fact is, if something costs money and you use it in your business, it reduces your profit and adds to your expense.

BENEFITS

Later, as your business grows and you begin to hire people, you'll learn about other expenses. These include such things as unemployment insurance, state and federal withholding taxes, and so on. And don't forget benefits.

If you're now working for a large company, you may take benefits for granted. When you hire people, you'll have to develop a benefits package of things like vacation pay, health and life insurance, holidays with pay, and sick days. Sick days take on a whole new meaning when it's *you* paying them. As a rule of thumb, a competent benefits package can add 25-50 percent to your cost of paying salaries.

You can see that the simple formula $\text{REVENUE} - \text{PRODUCT COST} = \text{PROFIT}$ is dangerously deceptive. When you analyze these things and subtract them from revenue, you'll wind up with a *Net Profit/Income Before Tax*. Then Uncle Sam will demand his piece of the action... that is, assuming you have a profit. Then and only then will you arrive at a figure that represents what your business has earned.

CASH, NOT PROFIT, PAYS BILLS

Cash is grossly misunderstood by a surprising number of businesspeople... particularly in large companies. Cash, not profit, pays the bills. Interestingly, a highly profitable small company can still go bankrupt if it doesn't have the cash to pay its bills. Conversely, a company that is losing money and filing for bankruptcy protection to work out its credit problems can continue to operate *if it has built up a cash reserve* to pay its bills.

Like it or not, we live in a credit-oriented world. If you're selling to dealers, they will demand a payment schedule that makes partial payments at 30-, 60-, or 90-day intervals. And that will mean more cost to you, to follow up and *get paid* for what you've sold. You'll send invoices, and then statements, and then past due statements to keep the payment pressure at a peak.

Standard accounting practice will let you record profit, when you actually ship a product. But that's a far cry from actually getting paid for the shipment. The payment schedule can begin to drag out. The 30-day mark can become 45 or even 60 days, and the whole cash flow structure begins to crumble.

NO SURPRISES

Nasty surprises can be fatal. You can produce and ship products in large numbers. You can record revenues and tremendous profits as your accounts receivable skyrocket. And your business can literally fail because of its sales success, overextended credit, and your inability to pay the bills.

Face the fact, too, that some of your customers will never pay their bills. Their businesses will fail, and you'll have to write off the revenue, and take it as a loss. This will save you money at tax time, but the cash loss — your cost — is a total loss.

The message is simple: define your costs — *all* your costs. Be realistic in defining profit. Expect the availability of cash to lag behind the sale and resultant revenue, sometimes by many weeks. Plan to buffer your business against cash shortages and keep a consistent and vigilant hand on the controls. In short...

Understand what profit really is — and then manage the cash. It's your lifeblood.

GET FORTH RIGHT

■ If you've been putting it off, now's a good time to come Forth. **GS16Forth II**, an upgrade of the original Forth implementation for IIGS, offers a range of new abilities designed for GS/OS System 5.0 and its tool sets. The product now compiles standard text files, so you can write source code on any word processor or development system that creates ASCII files. Also new is a desktop interface for easy writing, compiling, and debugging of code. Error messages are rendered with complete descriptions, rather than just numbers. Included in the GS16Forth II package is a LOGO system for newcomers to the language; you can use it to create complex screen graphics with turtle commands entered directly from the keyboard. A version of the board game Go is included as part of the tutorial. GS16Forth II requires a IIGS with at least 768K. It costs \$49.95, or \$15 for an upgrade. *GSF*, 1049 Shady Lakes Circle S., Palm Beach Gardens, FL 33418; (407) 775-1782.

CIRCLE NUMBER 150

CREATURES FEATURED

■ Ever met a skelk? How about a gnu-duck? You won't find them in any zoo, but your students might find them in **Creature Cube**, a 3-D program that teaches inference skills. A sequel to the award-winning education program Safari Search, Creature Cube pits the skills of 4 to 12 players against 10 games that develop problem-solving skills and logical thinking. In the title activity, a fictitious creature — a unidog (unicorn/dog) or perhaps a foxken (fox/chicken) — hides in a segment of a

three-dimensional cube, and players must determine its lair by trial-and-error. Another game is like battleship, but involves hidden markers and clues. And in yet another game, students create buildings and even cities out of multi-colored cubes. Creature Cube costs \$65, and includes a 5.25-inch disk, backup, and teachers' guide. *Sunburst Communications Inc.*, Pleasantville, NY 10570; (914) 769-5030.

CIRCLE NUMBER 151

AFTER DARK

■ You no longer have to listen to those tales of **Dark Castle** from your friends in the Mac world, because now you can run it on your IIGS. As if you didn't know, this best-selling game is set in a haunted fortress of the Middle Ages. You're armed only with a handful of rocks, a little elixir, and some other odds and ends, but you have to ward off flying monkeys and careening fireballs, to say nothing of Merlin's malevolent magic. But even if you fail in your mission, you'll still enjoy the spectacular color graphics and more than 70 digitized sounds along the way. **Dark Castle**, \$44.95, runs on a IIGS, and supports the SuperSonic Card from MDIdeas. *Electronic Arts Distribution*, 1810 Gateway Drive, San Mateo, CA 94494; (415) 571-7171.

CIRCLE NUMBER 153

MAPS ALIVE

■ A "living map" in **USA GeoGraph** will help you learn about the 50 states, plus six territories and the District of Columbia. A 105-category database, which can be viewed in text or graphic modes, is linked to the map, and called by just a mouse click. Easy-to-use commands let you compare states and observe economic, demographic, historical, and environmental patterns. Other features include zooming, English and metric measurements, the ability to add database

categories, and the option to print anything displayed on the screen. Also available: **World Geograph**. **USA Geograph** runs on Apple IIGS computers with at least 768K of memory, ROM Version 01 or greater, a mouse, color monitor, and a 3.5-inch disk. The program comes with two 3.5-inch disks, a classroom guide, and user's guide. It costs \$139. *MECC*, 3490 Lexington Ave. North, St. Paul, MN 55126; (800) 228-3504 or, in Minnesota, (800) 782-0032.

RAW DATA

ON-LINE LEISURE

■ GENie users can now plug into their favorite pastimes by modem, courtesy of the Hobby RoundTable. It's among the newest of GE's RoundTable services, featuring on-line activity about model aviation, model boating, radio-controlled cars, model railroading, static (plastic, wood, and paper) modeling, dollhouses and miniatures, games, collectibles (die-cast vehicles, stamps coins, comic books, baseball cards, and more), arts and crafts, model rocketry, wines, treasure and relic hunting — even beekeeping. The Hobby RT features a bulletin board for posting and reading messages by category, real-time conference ability, and software libraries from which users can download public domain software about their hobbies. Subscribers can also upload files they want to share with others — for free. Weekly conferences with special guests — industry representatives, well-known hobbyists, and national or international award winners — are held on Thursdays at 9 p.m. There is no charge for RoundTable activity beyond GENie's hourly rate, which ranges from 5 to \$18 depending on time of day and access speed. (There is also a \$29 registration fee.) For more information, contact GE Information Services at 1-800-638-9636, or type HOBBY\$ at any GENie menu prompt.

by Doug Herold

PILOTS GET THE BLUES

■ Want to add a new loop to your simulated flying activity? **The Blue Angels** is a formation flight simulator. Put on these wings and you'll learn 25 air-show maneuvers as you perform and practice in three types of exhibition. You can pilot any of the four planes in the formation — and view the action from your cockpit, a chase plane, hot-air balloon, or the grandstand.

You can even make a random tour of the airfield in free-flight mode. Check ideal flight paths against your own, review your course in 3D, and catch the action in instant replay. You could end up in the Pilots' Hall of Fame. **The Blue Angels**, \$44.95, requires a IIGS. *Accolade, 500 S. Winchester Blvd., Suite 200, San Jose, CA 95128; (408) 985-1700.*

CIRCLE NUMBER 154

CARMEN TO GO

■ You're just batty about Broderbund's world-hopping bandit, right? Now you can bring her along wherever you go, thanks to the **Carmen Sandiego Merchandise Collection**. Be the envy of Interpol and the Apple of the underworld's eye with your official Carmen tee-shirt, sweatshirt, watch, poster, portfolio, and stickers. All are emblazoned with Carmen's name and/or mug. The stickers even come in two varieties: static stickers for those temporary placements and sticky stickers (Mom oughta love these) for permanent display on skateboards, bikes, the baby grand, whatever. These hot goods range in price from \$1.25 to \$24.95

and are available from — bet you'd never guess! — **Broderbund Software Direct, P.O. Box 12947, San Rafael, CA 94913-2947; (800) 521-6263.**

ZBASIC 4.0 Full-Featured COMPILER

For ANY Apple
IIGs, IIfx, IIfx or II+ (Mac too!)

- ✓ **The Most Accurate Math:** Up to 54 digits
- ✓ **ProDOS™ Compatible** (128K and 64K)
- ✓ **Incredible Graphic Support:**
 - Double Hi-Res (16 Colors)
 - Regular Hi-Res
 - Integrate text and graphics!
 - Customize your character sets
- ✓ **Multi-line IF/THEN/ELSE and FN**
- ✓ **BUILT-IN FULL SCREEN EDITOR:**
 - Memory-to-memory compilation saves time. No need to switch back and forth between the editor and the compiler.
 - Works in 80 or 40 column modes!
- ✓ **DO/UNTIL and WHILE/WEND supported**
- ✓ **NO ROYALTIES OR RUNTIME FEES**
- ✓ **COMPLETE MOUSE SUPPORT**
- ✓ **/RAM DISKS to 8 megabytes!**

Experts Agree... ZBasic is Superior!

"ZBasic is a step-up for those that have a specific need which outstrips Applesoft... the \$90 investment (now only \$50) will be well rewarded when you think about the time you save."

A.P.P.L.E. C.O.O.P.

"ZBasic is unquestionably an excellent implementation of the language... (and) it comes with one of the best user manuals in the industry."

InCIDER

Without Applied Ingenuity you're **SUNK!**

Diver: David Westbrook, President of Applied Ingenuity. Photo: Phil Blood of Adventure Diving Center, San Dimas

Ever get the sinking feeling that you are paying too much for your hardware? Like a breath of fresh air Applied Ingenuity makes quality affordable.

Applied Ingenuity started a revolution with the first low cost hard drive and we continue to supply innovative products that will enhance your Apple computers capabilities.

We pioneered the InnerDrive product in a third of the time that it took the competition to imitate our concept. Now that's ingenuity!

NEW 100 meg SCSI InnerDrives. The fastest & largest IIGs hard disk available.

Falcon: 10 megabyte hard drive for the cost conscious user. The power of a hard drive is within reach of all users.

CDrive: The first and only internal hard disk for the IIG & IIG+. It's fast, inexpensive, and easy to install.

Ckeeper: Multifunction memory card for the IIG, Extended memory, RamSaver (programs stay running during power outages),

Clock/Calendar, Program Debugger/hacker, Screen dumper.

Keyboard X: Comes with an IBM type keyboard for your IIGs or Mac. Program the function keys and keyboard keys for any macro routine. Compatibility with any hardware or software.

VCR Backup: Tired of the constant disk swapping when backing up onto floppy disks? Backup onto your home VCR. Convenient, low cost.

InnerDrive: The first internal hard disk for the IIGs. It's 100% compatible, fast and affordable. InnerDrive has proven effective, with more than a year of service and thousands of units sold. Our heavy duty power supply works automatically with all voltages. Unlike others it is cool running and features the first 16 bit data transfer for a IIGs hard drive. InnerDrive supports 8 partitions and unlike the competition, utilizes a visual drive indicator. InnerDrive is ProDOS and DOS 3.3 compatible.

OverDrive: Compact, and fast, we designed this low cost external hard drive for the IIG, IIG+, Laser 128, and IIGs.

Juice Plus: Up to 4 megabytes of memory for your IIGs. 100% Apple and DMA compatible.

Call for further details.

The Dark Heart of

■ Tired of the old hack and slash? Then bury those so-called adventure games and search for the heart of the matter in the **Dark Heart of Uukrul**. Using single-key commands, you'll guide four characters into the colorful, three-dimensional catacombs of Eriosthe in search of the program's namesake tyrant. Uukrul secreted his heart deep within the mountain city; to find it and free the citizenry from his dark power, you'll have to use magic, prayers, spells, and weapons — perhaps all 120 objects nested in the program. Uukrul features auto-mapping, zoom-in ability during Hi-Res battles, control of individual characters, and male and female roles. The members of your contingent gain "experience," which will assist them — and you — in the quest. Uukrul, \$49.95, runs on Ile, Ilc, Ilc Plus, and IIGS computers. *Broderbund Software Inc., 17 Paul Drive, San Rafael, CA 94903-2101; (415) 492-3200.*

UP-GRADEBOOK

■ **Gradebook Plus**, the comprehensive teacher's assistant, has been upgraded to run under GS/OS System 5 and to work with an Apple mouse. The new version, 4.0, which is also available for other Apple II series computers, now has a screen-editing window and mini-word processor to create letters and reports. It can import text files from other word processors and export data in text-file form for use in AppleWorks or the Macintosh version of Gradebook Plus. The program can keep track of eight classes, with 42 students per class and 69 entries per student. It automatically calculates weighted scores, class statistics, and grades based on the instructor's grading scale. Gradebook Plus 4.0 costs \$59.95 (\$24.95 for an upgrade from 3.04) or \$199.95 for the site-license program (\$69.95 for an upgrade). It runs on Apple II Plus, Ile, Ilc, and IIGS computers, and comes on 5.25-inch or 3.5-inch disks. *Mindscape Inc., 3444 Dundee Road, Northbrook, IL 60062; (800) 999-2242.*

ORCA/M™ The Apple IIGS Assembler

You deserve the best, and that's what ORCA/M gives you!

Over 70 directives give you absolute control over your assembly language programming, and partial compilation of subroutines means your programs will be assembled at lightning speed.

The ORCA/M package requires no other software! Included with the assembler is our powerful program-mable shell, standard linker, and full screen editor, plus several utilities, subroutine libraries and numerous macros.

ORCA/M is the only assembler designed to work with Pascal and C on the Apple IIGS. With all of these features, and much more, it's no

wonder the ORCA/M environment is the development environment chosen by Apple Computer to become the APW assembler.

ORCA/M	\$69.95
ORCA/Desktop	\$60.00
ORCA/C	\$150.00
ORCA/Pascal	\$150.00
ORCA/Disassembler	\$49.95

NEW! ORCA/Disassembler is a full featured disassembler for the Apple IIGS. It will disassemble any standard OMF file, plus ROM, BIN, and SYS files from either the ORCA/APW shell or the desktop environment built into ORCA/Disassembler.

The Byte Works Inc.™

4700 Irving Blvd. NW, Suite 207
 Albuquerque, New Mexico 87114 (505) 898-8183

KNIGHTS TO REMEMBER

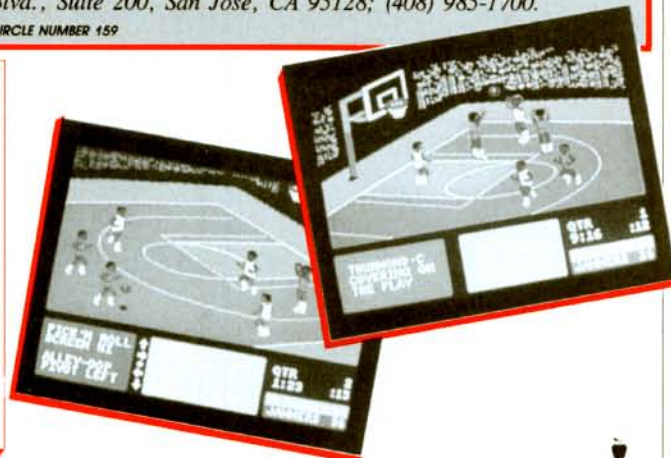

■ It's not just a castle or city, it's an entire, medieval world. **Knights of Legend**, which took programmer Todd Porter eight years to build, contains 30 hamlets, with a myriad of unique and colorful personalities in each. While on various quests, you'll be able to aim every blow and feel every wound. Fatigue will be as lethal as a swordblow. **Knights of Legend** has a menu-and-icon interface, and you might find the fantasy, role-playing elements familiar: The program is from the developers of the classic *Ultima* series. **Knights of Legend** costs \$49.95, and runs on II Plus, IIc, IIe, and IIGS computers. *Origin Inc.*, 136 Harvey Road, Building B, Londonderry, NH 03053; (603) 644-3360.

CIRCLE NUMBER 158

FAST BREAK OF CHAMPIONS

■ Cagers, rejoice! The richest rendering of basketball to date — three-on-three, full-court action — has arrived for the IIGS. **Fast Break**, in which you'll pit your court skills against the computer or another user, combines offensive and defensive pro-style play, passing, blocking, rebounding, fouls, violations, and, best of all, team play. You select and then control one center, one guard, and one forward; each candidate for your team has a scouting report that details his record of field goals, personal fouls, steals, and turnovers. At the start of play you'll put together your strategy from 15 available plays, including a fast break, man-to-man tight, man-to-man loose, trap, and double team. Or, you can use the Playmaker feature to call your own shots. Your players will score in a variety of ways, racking up three-pointers, slam dunks, and jump shots. **Fast Break**, for the IIGS, costs \$49.95. *Accolade Inc.*, 550 South Winchester Blvd., Suite 200, San Jose, CA 95128; (408) 985-1700.

CIRCLE NUMBER 159

STOP the PAIN of typing Apple programs!

Typing perfect, error-free Applesoft programs from magazines and books is a pain. And machine language programs are even worse! With Applesoft, if you make an error you have to retype the whole program line. With machine language, you may have to go back and retype the **WHOLE PROGRAM**.

AccuType uses word processing techniques to make program typing much faster and easier... for both kinds of programs.

- If you make a slip and leave out some program characters, AccuType lets you go back and **INSERT** them, without having to retype anything else.
- If you mistakenly insert extra characters, AccuType lets you **DELETE** them, and the rest of the program is moved to fill in the space — automatically.
- You can even search out a character or word every place it appears, automatically. It's great for finding important program variables and routines.
- And... if you're typing Nibble program listings, you get **INSTANT** error alerts with precision check codes for each Applesoft program line or each 8 bytes of machine language code.

To correct typos, you just move the cursor over the incorrect characters and retype them. It's that easy to use!

Remember, AccuType works with both Applesoft BASIC and machine language programs. Here's what AccuType users say:

"AccuType is one of those rare utilities that makes you wonder how you ever got along without it."

"I can enter programs I never would have attempted before!"

So, if you want to stop the pain of typing Apple programs... AccuType is for you.
You won't find anything else quite like it. Anywhere!

Yes! I want fast, error-free program typing.
Here's my \$29.95 for AccuType. Check One:

PIE THROWING & OTHER ANTICS

In my local bookstore I found two books by Jane Austen, three by Mark Twain, one by Charles Dickens, none by Marcel Proust, and six about The Three Stooges. Next to the bookstore, in the mall, is a software store. That store does not carry any of the writers, but it does sell **The Three Stooges** from Cinemaware, for your Apple IIGS. And, all I can say to that is:

Nyuck! Nyuck!

If you have been lucky enough never to learn of The Three Stooges, you should avoid this game. An appreciation of "Stoogemania" is a definite advantage. Rabid fans of Larry, Moe, and Curly (and you know who you are) will enjoy this game the most. But even those of us who only giggle, ashamed at the filmed antics of the Stooges, will find this game has a certain pie-in-the-face, finger-in-your-eye charm.

I don't think I can explain the cinematic antics of The Three Stooges. So, instead, I'll explain the game!

Billed as a "Cinemaware Interactive Movie" for your IIGS, The Three Stooges game lets you control the exploits of the slapstick trio as they careen, punch, and even work their way around Stoogetown. In this game, they are men with a mission as well as men with a schtick.

A widow with three beautiful daughters lives on the outskirts of town, where she runs an orphanage. The widow is having some bank-related problems. Yes, an evil banker is anxious to foreclose on the orphanage, putting the widow, her three daughters, and the indeterminate number of orphans onto the cruel streets.

But, thank goodness, she can turn to The Three Stooges. And, if that isn't lucky enough, she has you to control the Stooges. What a lucky lady!

Wise guys, eh?

The Stooges on the screen are smaller than the original actors, but this is a cartoon version of the Stooges, and it's more important that the faces be recognizable. They are. Also, gag lines and Stooge sounds are stored on disk to be unleashed when needed.

There's just no doubt the real Three Stooges are on your screen.

It's up to you to find enough money in Stoogetown to pay off the banker. Five grand will pay off the orphanage's mortgage, ten will pay off the mortgage and repair the orphanage. An unspecified amount "more than that" will win the widow's daughters for the Stooges. (But don't you think the girls would run away from home first?)

The game is played on a map of a winding street comprising 180 squares. From each square the Stooges can journey to any of the next six squares. But here's the first action sequence: The six possible squares are shown at the top of the screen and Moe's hand moves quickly from square to square. You must press the joystick button on the right square. Watch out, for many of the squares are mousetraps and you lose a day (from

Neil Shapiro is founder and Chief Sysop of CompuServe's MAUG. Write to him at MCU Inc., P.O. Box 520, Bethpage, NY 11714.

a 30-day limit). Worse still, each day the animation speeds up so it becomes harder to pick the right square.

The solution is a little bit of Stooze action! As Moe, you can knock some sense into Larry and Curly; the joystick button will make Moe feint, duck, poke, slap, kick, and punch. The more his blows land on Larry and Curly, the slower the animation becomes and the easier the game to play. But if he misses or gets clobbered in return, the animation speeds up.

If you land on a money square, you'll see the Stooges in an animated sequence: They'll walk to the square and find a moneybag or billfold. The streets of Stoozeville are not paved with gold, but many citizens seem to drop things.

On the other hand (or poking finger) there are ways to *earn* money. You can play doctor, which allows you to control the Stooges as they careen through a hospital to an operating room, picking up items from a nurse's cart along the way. Or you can race Curly as he eats crackers from a bowl before hungry oysters can get his meal. These and other sequences are controlled with the joystick. The faster you go, the more money you receive.

My favorite sequence is "Help Wanted: Waiters." This is a hilarious, animated pie-fight sequence. The Three Piemen are lined up

on the right of your screen behind a table of meringued ammunition. Across the hall are three upper-crusty people just asking for it, but armed with their own gloppy stockpile of pies. With the joystick (or keyboard) you can control any of the Stooze as they ducks and throw pies.

Wham! Blam! Splat!!! Woo! Woo! Boy, I only wish this sequence could be played by itself. Nyuck! Nyuck! What a riot. Ooops, sorry. Back to describing the game.

A Stooze trivia test comes up when you step on certain squares. I must admit I did not earn many dollars there, but true Stooze fans will be well rewarded.

All in all, The Three Stooges is a fun game. It is not a classic; I suspect it will become repetitive after a bit of playing. However, it's certainly a unique way to poke a lazy afternoon right in the eye!

The Three Stooges, \$49.95, is available from Cinemaware Corp., 4165 Thousand Oaks Blvd., Westlake Village, CA 91362; (805) 495-6515. It requires an Apple IIGS with 1.25 MB RAM; a joystick is optional. The program includes two 3.5-inch disks, manual, and an interesting short history of the Stooges.

A TURKISH DELIGHT

Broderbund's new **Prince of Persia** takes place, of course, in old Persia, not Turkey. But who could resist the subhead? Not I! This game really and truly is an unmitigated delight and it will thrill anyone with the slightest interest in arcade games.

Every so often, every few years, a game for the Apple II comes along that pushes the ol' Apple II to new heights, new wonders, new achievements. Later, all other games in its category must be judged against it. Prince of Persia is that game for this year.

Remember the Karateka game? This new one was written by Karateka's author, Jordan Mechner. He has taken the fluid animation of Karateka to new heights.

Jaffar the Grand Vizier has stolen both power and your girlfriend — who happens to be the deposed Sultan's daughter. Jaffar throws you into the Sultan's dungeons and gives the Princess a choice between marriage and death — within the hour. All of this, by the way, is shown in a brief but well-animated "movie" at the beginning of the game.

So, there you are, in the dungeons. Can you get out? Can you save the Princess? It will not be easy, but it will certainly be the arcade experience of your life.

You see, what makes this game so wonderful (am I gushing?) is that the little onscreen character does not move like a little, onscreen character — he moves like a person. With the joystick you can have him swing up lithely onto a ledge and duck under a falling portcullis, have him leap madly over booby-trapped pits, sprint across bridges that fall apart underfoot, have him swordfight his way through encounter after encounter.

When you first enter the dungeon, the first task is to find a sword with which to fight. That will take you to room after room on the first level, where many training-type challenges await you. Many rooms are action puzzles. For example, you have to run through a portcullis but have to time your run exactly right because a certain floorboard sends it rushing downward, closing off the exit.

Once you have a sword in hand, the first few swordsmen are fairly easy to overcome. But, by the second level of the dungeon, you'll find yourself getting skewered more frequently. Luckily, on this level, there are various potions you can find to restore your strength.

The only thing I can criticize about Prince of Persia is that the

Conflict in the Middle East

swordfighting routines — while they look wonderful — just do not *feel* quite right because of the simple joystick control. All you can do is to strike, parry, advance, and retreat. It would be nice to aim the sword; that would add another dimension to the fighting.

But nothing is perfect. And I think you'll agree Prince of Persia comes as close to that as any arcade game has come in a long, long, long time.

Now, if only I could just rescue that hapless Princess, I could sleep nights.

Prince of Persia, \$34.95, is available for the Apple IIe (128K), IIc, and IIGS from Broderbund Software, 17 Paul Drive, San Rafael, CA 94903-2101; (800) 521-6263. It includes one 5.25-inch disk and a manual.

THE nibble LIBRARY...

You'll Be Amazed At What

It only takes a Minute.

One Minute Apple Programs is packed with nearly 200 easy-to-enter, one- and two-line programs that do incredible things.

You'll like the functionality and power packed into each tiny program. After just one minute of easy typing, you can make your Apple screen come alive with a colorful kaleidoscope. Or, for more excitement, find your way out of a maze, elude a giant snake, or try to dodge the obstacles whizzing toward you on a race track.

Need a momentary diversion? Raise the curtain on a graphics picture, or fracture a text display and watch it fly off the screen.

You'll also get valuable utility programs and plenty of clever tips and routines to get more out of your Apple... and all it takes is a Minute! An optional disk is available with all the programs.

Get One Minute Apple Programs... for Hours of Fun. Only \$9.95 for the book and \$10.00 for the disk.

Applesoft is EASY.

Hands On Applesoft helps you learn programming the easy way... by writing programs. It is a practical, step-by-step approach for beginners. You learn the art of creating Applesoft programs from start to finish at the keyboard.

Dozens of examples show you exactly how to write, modify, and debug your own programs. *Hands On Applesoft* shows you how to control your disk too. It includes easy to understand instructions for mastering disk operations.

Bugs! The chapters on debugging show you how to

untangle the program errors and stamp out the bugs. Whether your goal is to tinker or to really learn programming, *Hands On Applesoft* is the place to start. And you can get an optional disk with all the program examples that includes Turbo Editor (for easy program entry) and Applesoft Tutor (for fast error checking).

Start Your Applesoft Adventure today. The book is a bargain at \$12.95... The disk is \$14.95.

Unlock the Secrets.

Learn the secrets locked inside your Apple with *Apple Secrets*. This unusual collection of 75 short programs and tips makes your Apple perform in ways you never thought possible.

You'll learn how to make your Apple accept ANY character from the keyboard; how to hide machine code in REM statements; how to make a program that cross references all your variables; and even make a screen scroller that moves your text wherever you want it. You'll create vivid graphics displays, speed up Applesoft, and much more.

Each of the 75 articles is a foolproof method for streamlining your programs, and most include subroutines you can use in your own programs. Even if you're a beginner, you'll enjoy putting your Apple through its paces. And you can even get the programs on an optional disk.

You'll be surprised at what you can do. The book is \$19.95... and the disk is only \$10.00 more.

Plug into the Power.

Applesoft Power Tools is a library of easy-to-use and very powerful programming utilities. They'll help you to create faster, more professional programs with optimizers, program editors, and documentors.

You'll edit with ease, using the word processor-like features of Applesoft Turbo Editor. It will save you hours of typing. You'll seek and destroy bugs automatically with Programming Helper and Microscope.

You'll squeeze out excess code with the Crunchers, so your programs run fast and lean. Print formatted program

listings, or cross reference your variables and the lines in which they appear. Add sound effects, or your own graphics. Or goof-proof your subroutines. You get them all — ready to type and run.

Plug in Applesoft Power Tools. They're terrific! Only \$19.95 brings you the whole tool kit.

SALE PRICES!
35% off Single Books!
All Six Books for Only \$49.95

You Can Do with your Apple

Lightning Fast Action.

The Beginner's Guide to Assembly Language teaches you the nuts and bolts of the fastest, most powerful language for your Apple... Assembly Language.

You'll learn how to write fast, flexible routines that turn your Apple into a speed demon. The type of routines that produce professional graphics, full-range sound, and superfast arcade games. Learning is easy, because the book is loaded with side-by-side examples and comparisons to the language that is built into your Apple — Applesoft BASIC.

It puts you in command of the real benefits of Assembly Language: Speed, Power, and Compactness. You don't have to be a genius to learn it. The 12 chapters show you how. And you can even get the program examples on an optional disk.

The Beginner's Guide makes it fun to learn.
The book is \$19.95... and the disk is only \$10.00 more.

More Apple Secrets.

Uncover more mysteries hidden within your Apple with *More Apple Secrets*. It's a treasure trove of more than 70 of the best short Tips and Techniques from Nibble.

Nibble's experts teach you their tricks for creating Macintosh-like windows from Applesoft, automatically converting lower-case letters to upper-case, compressing Hi-Res pictures so that they take up less disk space, and speeding up programs enough to even hear the difference!

You can also learn how to add dozens of new colors to your graphics screen, hide FID in memory, add two-voice music and sound, and just customize your Apple's "beep".

All these programs and many more are yours with *More Apple Secrets*. And you can get the programs on an optional disk.

Discover the power within your Apple.
The book is \$19.95... and the disk is only \$10.00 more.

The Nibble Library is a unique collection of books that contain hundreds of exciting and valuable programs for your Apple. All the programs have easy, step-by-step instructions for putting them into your Apple's memory; you don't have to be a programmer to type and run them. You'll also get comprehensive articles that describe how to use the programs and how they work.

Whether you have an Apple II, II Plus, IIe, IIc, or IIGS, you'll discover that it's a real thrill to see your first program running and to know that you did it yourself!

52 Domino Dr., Concord, MA 01742 1-800-888-1660

by Robert Albanito

The numbers went in one ear, out the other, then floated in air before my eyes: 12 percent, 3 points, 30 years, \$946 a month... They'd puff away and be replaced by even more grotesque combinations.

If you plan on purchasing a home, you will probably experience confusion, frustration, and doubt. Real Estate Advisor can help restore order to your life.

Its setup menu can be quickly changed to provide a comparison of mortgage scenarios, allowing you to determine which financing would best meet your needs. The program creates a five-year, itemized report of mortgage costs, most deductions, estimated taxes, and estimated tax refunds. Also, it creates a four-page report comparing the cost of owning a home to that of renting. (The results might surprise you!)

Real Estate Advisor also gives you a report of mortgage payment tables, with interest and payment ranges of your choice, allowing you to see the result of rate changes. You can also make a report of net mortgage payment tables showing your mortgage payments after estimated tax refunds.

Finally, the program makes yearly and monthly amortization schedules that show the principal, interest, loan balance, and total interest and mortgage payments for the life of the mortgage. All reports can be displayed on the screen or sent to your printer.

USING THE PROGRAM

When you run Real Estate Advisor, you will be asked to "get or create" a file. If this is your first time through, there will be no file to get, so select "create" and the setup menu (Figure 1) will appear on the screen. The setup

REAL ESTATE ADVISOR

Robert Albanito, P.O. Box 30047, Chicago, IL 60630. This program is compatible with DOS 3.3 and ProDOS. It requires an 80-column IIe, IIc, or IIGS.

menu contains the information used by the program. It has 26 line items, with values that can be changed to fit almost any scenario. When you select create, the setup menu uses data contained within the program to obtain its values. In the Modifications section of this article, you will learn how to change this data so the setup menu will appear with your personal profile. There are eight sample reports with explanations to help you understand how to interpret each report.

You can move the cursor with the Left and Right-Arrow keys; a value will be highlighted with each keypress. When you reach a value you want to change, press the Return key. This removes the old value so you can enter a new one. Commas are unnecessary; the program will insert them for you.

After entering a new value, press the Return key again. Your new value will be highlighted to let you know it has been changed.

The program checks most entries to see if they are acceptable. If your entry is not acceptable, an explanation will appear and the original value will return, allowing you to enter another value. The setup menu instructions (Figure 2) contain a list of what the program expects in each line item.

After entering your changes, you can use the four options on the bottom of the screen. Pressing the Escape key will quit the setup menu and display the main menu; the P key will print the setup menu on your printer; the S key will let you save the setup menu values to disk; and the N key will let you retrieve a saved file from disk. When you retrieve a file, you will be asked to specify the slot number, the drive number, and the filename or pathname, depending on the version of DOS you are using. You can also press the question mark key to see a catalog of the disk.

The main menu (Figure 3) has six options, and uses the setup menu information to create reports and send them to the screen or your printer. You may want to look at the setup menu while going through each report.

The itemized five-year report (Figure 4) lists information for the first five years of a mortgage. The top left of the report contains the value of home, amount of mortgage, interest rate, and length of mortgage. These amounts are from the setup menu and let you see the mortgage information from which the report is derived. The upper-right section tells you how much money is needed to purchase the home. Under that, you'll find the five years of the report, each above a column of values for that year. The left side of the report identifies the values in each column.

The first five lines contain mortgage information. For example, in 1990 the monthly mortgage payment is \$859.68 and the additional monthly cost is \$83.33. The total

SETUP MENU INSTRUCTIONS	
VALUE OF HOME	The home's cost.
AMOUNT OF MORTGAGE	The amount you are going to finance.
INTEREST RATE	The interest rate currently available.
LENGTH OF MORTGAGE	The number of years for which you want financing.
PROPERTY TAX	The yearly cost of taxes on the property.
MORTGAGE INSURANCE	The yearly cost of insurance.
NUMBER OF POINTS	The percentage of the loan the lender charges for the loan, usually 2-5.
CLOSING COSTS	Additional charges including application fee, recording fees, city revenue stamps, and attorney's fees. If unknown use \$1,000.00.
I.R.A. CONTRIBUTION	The amount put into your I.R.A. accounts.
CHARITIES	The amount contributed to charity.
TOTAL PERSONAL INT. PAID	The interest paid on personal loans or credit cards.
MARITAL STATUS	Enter M if you're married, S if you're single.
PERSONAL EXEMPTIONS	The number of people you support.
SALARIES	The yearly income earned.
OTHER TAXABLE INCOME	Any taxable income. Interest from CDs, bank accounts, credit unions, S & Ls, or bonds.
F.I.T.W.	The Federal Income Tax Withheld from your paycheck or other income. The program will calculate this based on the (W4) format if you enter zero.
STATE INCOME TAX	The percentage taken out of your paychecks.
MONTH OF FIRST PAYMENT	The month number your first mortgage payment begins.
OTHER YEARLY HOME COSTS	The yearly cost of electricity, gas, water bill, and maintenance.
APPRECIATION OF HOME	The yearly percentage house values increase in your area. If unknown, estimate 4-7%.
MONTHLY COST OF RENT	The cost you pay each month to rent.
OTHER YEARLY RENTAL COSTS	Yearly cost of gas, electricity, and maintenance.
YEARLY RENT INCREASES	The percentage your rent increases each year.
TAX DEFERRED/FREE RATES	The percentage you can get yearly from tax-free and tax-deferred investments.
ESTIMATED INFLATION	The estimated rate of inflation. If unknown use 4%.
CURRENT YEAR	Enter the year. Example 1990

Figure 5: Expenses associated with owning a home

monthly payment, \$943.02, is the total of the first two lines. The total principal is \$2,425.37 and the loan balance is \$77,574.63. Next are total interest (\$7,890.84), property tax (\$0), IRA (\$2,250), mortgage insurance (\$0), points amount (\$2,400), closing costs (\$1,000), state tax (\$1,000), charities (\$500), personal interest (\$0), and personal exemption (\$4,000). These are combined for total deductions (\$19,040.84).

Income (\$40,000.00) and other taxable income (\$0) are combined in the next line, total income (\$40,000). The next eight lines contain tax information. The adjusted gross income is your total income minus your total deductions (\$40,000 - \$19,040.84 = \$20,959.16).

The estimated federal refund is calculated by subtracting estimated federal tax from federal income tax withheld (\$4,312.50 - 3,143.87 = 1,168.63).

The estimated state refund is calculated by subtracting the estimated state tax from the state tax withheld (\$1,000 - \$893.75 = \$106.25).

The total refund is calculated by adding the estimated federal and estimated state refunds (\$1,168.63 + \$106.25 = \$1,274.88).

The last line is net mortgage payment. This is figured by dividing total refunds (a yearly amount) by 12 to get the monthly refund amount. Then it is subtracted from your monthly mortgage payment (\$1,274.88 / 12 = \$106.24; \$859.68 - \$106.24 = \$753.44, or net mortgage payment).

The rental and ownership analyses create three reports and a summary, demonstrating which is most beneficial, owning or renting.

Ownership Analysis

The Ownership Analysis is a two-page report. The first page (Figure 5) contains the expenses associated with owning a home. The upper part of the report shows you the value of home, amount of mortgage, interest rate, total needed to purchase, length of mortgage, tax deferred/free rates, appreciation of home, and estimated inflation. Again, this information is from the setup menu.

Below these items are six columns. The first column shows you the year the values in each line occur. In the next column, other cost & mortgage insurance, the values \$2,000 and \$0 from the setup menu are added together and displayed in the first year. That amount is multiplied by the estimated inflation (4 percent) and added to the result to yield a value for the second year (\$2,000 + \$0 = \$2,000; \$2,000 × .04 = \$80; \$2,000 + \$80 = \$2,080). The process is then repeated to give you the next year, the next, and so on. Take a look at the value in the 15th year; you will be paying \$3,463.35 then if your increases keep up with inflation.

The next column, property tax/inflation, is calculated in the same way. Mortgage payments will remain constant unless you have an adjustable rate mortgage (ARM), which fluctuates with interest rates. ARMs are impossible to calculate — no one can predict interest rates.

Lost interest on savings represents the yearly, compounded interest you lose for removing \$24,400 from your bank account for the down payment. This is calculated in the same way as the first two columns, except the program uses the tax deferred/free rate, 6 percent. Actual home cost is the total of the other columns (\$2,000 + \$1,000 + \$10,316.21 + \$1,464 = \$14,780.21).

Finally, the bottom of the columns show the totals for each.

The second page is the income part of the Ownership Analysis (Figure 6). The top of the page is the same as the previous page, and as before, the first column shows the year. The estimated tax refunds column, the projected refund you will receive from the IRS is much larger in the first year than in the second year; you have more one-time deductions in the first year. The minus signs before the figures in the last two years indicate you *owe* the IRS the indicated amounts, assuming your income and deduction status remain the same.

The appreciation column contains the amounts your home will increase in value during the represented years. It is figured by multiplying the value of home by the appreciation of home ($\$100,000 \times .05 = \$5,000$).

The result is added to the value of your home. The process is repeated to obtain values for each of the following years.

The net cost of home is calculated by taking the actual home cost and subtracting from it the estimated tax refunds. Appreciation is subtracted from the result ($\$14,780.21 - \$1,274.88 - \$5,000 = \$8,505.33$).

Principal paid, cumulative equity, and cumulative home value will be useful if you want to sell, refinance, or take out a second mortgage.

The principal paid column contains amounts that went for principal from your mortgage payments during the indicated years. In the first year, cumulative equity is calculated by adding the appreciation and principal paid to the value of home and subtracting from that the amount of mortgage ($\$100,000 + \$5,000 + \$2,425.37 - \$80,000 = \$27,425.37$).

After the first year, appreciation and the principal paid are combined with cumulative equity to get the next value for cumulative equity ($\$27,425.37 + \$5,250 + \$2,679.34 = \$35,354.72$).

Cumulative home value is calculated by adding the appreciation to the value of home (first year: $\$5,000 + \$100,000 =$

$\$105,000$; second year: $\$5,250 + \$105,000 = \$110,250$).

Totals end each column, except for the two containing cumulative values; they reflect current amounts.

Rental Analysis

The Rental Analysis (Figure 7), is a one-page report. The values for monthly cost of rent, other yearly rental costs, yearly rent increases (a percentage), tax deferred/free rates (a percentage), total needed to purchase, and estimated inflation are obtained, once again, from the setup menu.

The values in other costs with inflation are calculated in the same manner as the examples from the last report that involved inflation percent. Rent cost with increases

is a yearly amount, calculated by multiplying the monthly cost of rent by 12 ($\$500 \times 12 = \$6,000$).

The rest of the years are figured by multiplying the yearly rent increases (a percent figure) by the yearly rent cost and then adding the result to yearly rent ($\$6,000 \times .04 = \240 ; $\$6,000 + \$240 = \$6,240$, or second-year rent; $\$6,240 \times .04 = \249.60 ; $\$6,240 + \$249.60 = \$6,489.60$, or third-year rent).

Rental payments are calculated by adding the other costs with inflation amounts and the rent cost with increases amounts ($\$1,000 + \$6,000 = \$7,000$).

The amounts listed under cash saved by renting are calculated by taking the values from the rental payments and subtracting

them from the actual home cost values that are listed on the first page of the Ownership Analysis report (\$14,780.21 - \$7,000 = \$7,780.21).

Interest yield on savings is the interest you would earn on the money you saved by renting instead of purchasing. The value is obtained by multiplying the first-year value from the cash saved by renting column by the tax deferred/free rates percent (\$7,780.21 × .06 = \$466.81, or first-year interest yield).

The amounts are combined with the value for the second year's cash saved by renting, and the result is multiplied by the tax deferred/free rate again to obtain the second-year interest yield on savings amount. The process is repeated to obtain the third year, and so on (\$7,780.21 + \$466.81 = \$8,247.02; \$8,247.02 × 7,708.05 = \$15,955.07; \$15,955.07 × .06 = \$957.30).

Net cost of renting is calculated by adding the yearly cash saved by renting amounts to the yearly interest yield on savings values, and subtracting the result from the yearly values under rental payments (\$7,780.21 + \$466.81 = \$8,247.02, or first-year savings; \$7,000 rent expense - \$8,247.02 savings = \$ -1,247.02 net).

In the example, income exceeds expenses. The negative net means you actually saved \$1,247.02 that year while paying nothing for rent. A positive number will reflect a loss for the year.

Totals end each column.

The summary (Figure 8) contains important column totals from the ownership & rental reports, listed side by side so you can compare the data more easily.

The first four items, other costs, mortgage/rent, property tax and lost interest on savings, are combined to yield the total cash expended. This is the total amount owning or renting costs you.

The next four items — cash saved by renting, interest yield on savings, tax benefits

(or refunds), and appreciation of property — are combined to yield the total income and equity values. This is the amount of income owning or renting will provide you.

Net cost is the amount owning or renting will cost you. It is obtained by subtracting total income & equity from total cash expended (\$248,889.92 - \$114,853.34 = \$134,036.57, or net cost of owning; \$140,165.11 - \$180,885.06 = -\$40,719.94, or net cost of renting).

A positive net amount indicates an expense; a negative net amount indicates a savings. So, in the summary, it would cost you \$134,036.57 to own a home, and save you \$40,719.94 to rent.

Selecting the mortgage and interest rate tables option will take you to the mortgage tables menu. You will have three options: The mortgage rent tables, second-year net tables, and the main menu. If you choose either of the first two options, you will be asked for increment amounts. The amounts will start with the cost of the home above the first column, and each column thereafter will decrease by the increments you choose.

Do not use commas when entering the amount. If you choose not to enter an amount, the program will default to increments of \$2,000.

The mortgage payment tables option will show the monthly mortgage payments for the different loan balances and interest rates. The interest rates are in the first column on the left, beneath the title RATE. The column range is 3 percent below to 0.5 percent above the interest rate in the setup menu. This range lets you compare the mortgage types available. After the rate column are eight columns, each topped with a mortgage amount. Each column contains the amount of your monthly mortgage payment under the specified percentages and mortgage amounts. For example, a \$90,000 mortgage at 10 percent would give you a monthly mortgage payment of \$967.14; a \$96,000 mortgage at 9.5 percent would give you a monthly mortgage payment of \$1,002.46. The value of the home is from the setup menu; all payment tables will start with the amount in the setup menu.

The second-year net tables option is iden-

Ready for the ultimate communications software? ReadyLink.™

Using the right communications software is the key to getting the most from your modem. The ideal software would be intuitive enough to speed you through the hassle of logging on, flexible enough to work with mouse or keyboard, sophisticated enough to reach virtually any bulletin board or service and simple enough to be useful right away ... even for beginners. ReadyLink™ does it. And more.

For starters, yes, ReadyLink will work with your IIGS, enhanced IIc (128K), IIc or IIc Plus— it's fully Hayes compatible and features 132-column VT100 emulation. ReadyLink supports XModem, XModem/CRC, XModem/ProDOS and YModem with automatic protocol selection on both sending and receiving. The Mac-like desktop interface can be operated from either mouse or keyboard and automatically configures the hardware setup.

Open two windows at once.

For the first time, two mobile, resizable

windows can be open at the same time. You can actually work with the built-in text editor window *while* the on-line window continually updates incoming messages and information. Access your own files (or create new ones), edit the text with pull-down menu commands like cut, copy, paste, find and replace; then send the text in perfect, edited form. Even print text directly from the window—all without breaking contact with the on-line window.

Software that learns by watching.

Our engineers have developed a rich macro language that allows you to easily learn to write your own macros. ReadyLink can autodial a number for you, log on, redial or disconnect if the number's busy—and do it all automatically. In fact, the software actually "watches" you log on the first time and "learns" how to do it *for you* the next time.

The macros can be pre-compiled for added speed and up to 18 macros can be executed with a single keystroke. An unlimited number of macros can be executed via a proper command and the language includes such esoteric features as integer variables, complex expressions, conditional execution and subroutines. All keyboard commands can be re-assigned to any key.

Conference mode.

Tired of watching your messages broken up by incoming transmissions? ReadyLink's

built-in conference mode lets you enter a sentence or message in one piece and then send it all at once.

Track costs as you go.

ReadyLink also comes with an automatic rate calculator that watches those phone bills for you, by continually metering online costs.

Compare AE's ReadyLink with any other communications software. For completeness of features, ultimate flexibility and ease of use. For beginners and bulletin board junkies alike, ReadyLink does it.

Order today!

To order or for more information, see your dealer or call (214) 241-6060 today, 9 am to 11 pm, 7 days. Or send check or money order to Applied Engineering. MasterCard, VISA and C.O.D. welcome. Texas residents add 7% sales tax. Add \$10 outside U.S.A.

tical to the mortgage payment tables option, except that the amounts are your second-year net monthly mortgage payment. This is the monthly payment after the estimated tax returns have been subtracted from it. The first year is not used; usually, it is a partial year and contains one-time deductions.

If you choose the third option, and return to the main menu, you'll be able to select the option for amortization schedules. Once there you will have three options: yearly amortization schedule, monthly schedule, or return to the main menu.

The yearly amortization schedule shows the amount of mortgage, interest rate (a percentage), length of mortgage (in years), and monthly mortgage values in the upper-left corner. These values are used to calculate the amounts in the amortization table. The first column contains the year and the second contains the yearly mortgage payment. This is calculated by multiplying the monthly mortgage amount by 12 ($\$859.68 \times 12 = \$10,316.21$, or the yearly mortgage payment).

Paid interest is the portion of the yearly mortgage payment composed of interest for the loan. Paid principal is the total amount of your yearly mortgage payment used to reduce the amount of your loan. Loan balance is the amount of the loan remaining, calculated by subtracting the paid principal amount from the mortgage balance (first year $\$80,000 - \$2,425.37 = \$77,574.63$ loan balance; second year $\$77,574.63 - \$2,679.34 = \$74,895.28$ loan balance).

The last two columns are cumulative; one totals the interest paid and the other totals the mortgage amount paid.

The monthly amortization schedule is the same as the yearly schedule, except for the different time interval.

The remaining options let you return to the setup menu or quit the program.

ENTERING THE PROGRAM

Type in the program from Listing 1 and save it to disk with the command

SAVE R.E. ADVISOR

For more help with *Nibble* listings, see the Typing Tips section in this issue.

HOW THE PROGRAM WORKS

Line 90 turns on the 80-column card and jumps over most of the program's routines to the title screen in line 2470. Line 2480 sets the dimensions of the variables. Lines 2490-2500 read the data stored in lines 3630-3720. Lines 2520-2540 let you get or create a new setup file. If you elect to create a new file, the data in line 3720 is read and line 2580 sends you to the setup menu, which begins at line 2770. If you elect to get a file, line 2530 sends you to the subroutine starting at line 3180 to determine which slot and drive to use. Line 3220 determines the disk operating system being used and continues to lines 3260-3300 for the DOS

3.3 filename, or to lines 3340-3430 for the ProDOS pathname. Lines 3410-3420 check for a valid pathname. You then return to line 2530 and proceed to lines 2550-2560 to read the file. If the file is a Real Estate Advisor file, line 2580 sends you to the setup menu. If the file is *not* an Real Estate Advisor file, you go to the error routine in lines 3470-3620 and return to line 2520 to begin again.

Lines 2770-2810 display the setup menu. The correct arrangement of the amounts is accomplished by the subroutine in lines 130-200. Line 2820 obtains information from lines 2900-2920 to move correctly through the menu. Lines 2380-2870 let you perform one of four options: 1) exit the setup menu and go to the main menu in lines 2680-2820;

Modifications to the program will depend on changes to tax laws or IRAs.

2) print the setup menu (line 2840 jumps to lines 770-810 to turn on the printer); 3) save the setup with lines 2840-2850 (line 2860 adds the letters REA.FILE at the end of the data, so it can be recognized by the program); or 4) create a new setup file by going to line 2520. (Lines 2940-3140 are used to check some of the values entered in the setup menu, and will display a message if the value is incorrect.)

Lines 2680-2730 contain the main menu, and line 2680 lets you proceed to the selected routine. Lines 240-320 calculate the monthly mortgage payment, and lines 360-710 calculate the rest of the data used by the programs routines with the exception of line 1170, which performs calculations for the own vs. rent routine. Table 1 contains a list of variables and the values they represent in these routines. Variables A(1) through A(26) represent the setup menu amounts.

In the IRA routine line 420 checks to see if the value in A(9) (the IRA amount) is greater than \$0. If so, it goes to the subroutine in lines 690-720. Line 690 is for a single person; a full deduction is given if earnings are below \$25,000. If earnings are between

\$25,000-\$35,000, a partial deduction is calculated. The same applies to line 700, which is for married individuals. A full deduction is allowed for earnings below \$40,000, and a partial deduction is allowed between \$40,000-\$50,000. Line 710 rounds up to the nearest \$10. If earnings are above the allowable ranges, the variable EI will contain a negative number; when you return to line 420, it will make all negative values equal to zero. In other words, no deduction is allowed.

The federal income tax withheld is calculated in lines 550-570. Line 550 is used to calculate a yearly amount from a weekly FITW. If the amount in variable EW is above \$500, it is assumed the yearly amount was entered. If EW equals zero in lines 560-570, the yearly FITW will be calculated for you. Lines 580-590 calculate the estimated federal taxes.

The rest of the program's routines are straightforward and take the data supplied by the described subroutines and print it in various formats. All routines exit to lines 2590-2630, which reroute output to the screen, initialize the variables, and allow the setup menu to be restored to its original values if changes were made.

MODIFICATIONS

If your printer card is in a slot other than 1, change the 1 in PR#1 in line 770 to the number of the slot you are using.

The data in line 3720 can be changed to an individual profile so that when a file is created it will have most of the values already established. It currently contains values for the setup menu (Figure 1).

Modifications to the program calculations will depend on changes to tax laws or IRAs. Information for making the changes can be found in the income tax form the IRS mails you at the start of the year.

In line 450, the amount allowed for personal exemption is \$2,000. After 1989, the amount may be adjusted for inflation by the IRS.

In lines 560-570, the amounts for basic standard deduction are \$3,100 for single and \$5,200 for married. After 1989, the amounts may be adjusted if necessary for inflation by the IRS.

In line 580, the estimated tax for a married couple is 15 percent of adjusted gross income to \$29,750, and 28 percent for more than \$29,750. In line 590 the single estimated tax is 15 percent of adjusted gross income to \$17,850, and 28 percent for more than \$17,850. For the tax years after 1989, income brackets may be adjusted for inflation by the IRS.

In line 600, the personal exemption amount is \$1,000, or the same as the exemption in Illinois. Check your state income tax booklet for the correct value to enter in your state.

ing career, our own, nning.

C, and COBOL. Then, rounding out your training, you use your modem to "talk" to your instructor, meet other NRI students, even download programs through NRI's exclusive programmers network, PRONET.

Your career in computer programming begins with your FREE catalog from NRI.

For all the details about NRI's at-home training in Computer Programming, send the coupon today. Soon you'll receive NRI's fascinating, information-packed, full-color catalog.

Open it up and you'll find vivid descriptions of every aspect of your NRI training. You'll see the computer system included in your course up close in a special, poster-sized foldout section. And, best of all, you'll find out how your NRI training will make it easy for you to build that high-paying career—even a business of your own—in computer programming.

**RICK BRUSH,
NRI PROGRAMMER/ANALYST**

Start with training that gives you hands-on programming experience—at home and at your own pace. Training that begins with BASIC, then continues with Pascal, C, and COBOL—today's hottest computer languages. Training that even includes a powerful IBM-compatible computer, modem, and programming software you keep.

Start with real-world training. The kind of training only NRI provides.

Now with NRI's new at-home training in Computer Programming, you can be one of today's highly paid, creative team of computer wizards who give computers the power to carry out an astonishing range of business, professional, and personal applications. Now, with NRI, you can be a computer programmer, ready to build a high-paying career—even a business of your own—making computers do anything you want them to do.

The only programming course that includes a powerful computer system and software you keep.

Unlike any other school, NRI gives you hands-on programming experience with a powerful IBM compatible West Coast computer system, including 2400

need to succeed in programming, today's top-growth computer career field.

You need no previous experience to build a successful programming career with NRI training. Indeed, your NRI lessons start by walking you step by step through the fundamentals, giving you an expert understanding of the programming design techniques used every day by successful micro and mainframe programmers. And then the fun really begins.

You master today's hottest computer languages, gaining the skills you need to build programs for a wide variety of real-world applications.

With your personal NRI instructor on call and ready to help, you use your computer and software to actually design, code, run, debug, and document programs in BASIC, Pascal,

Send for your NRI catalog today. It's yours, free.

If the coupon is missing, write to us at the NRI School of Computer Programming, McGraw-Hill Continuing Education Center, 4401 Connecticut Avenue, NW, Washington, DC 20008.

I saw
it in
nibble!

Whenever you buy
or inquire about a
product offered by
one of our advertis-
ers, be sure to men-
tion that **you saw it
in Nibble!**

**Coming
Soon!**

► **Sound Wizard:** Enrich your Applesoft programs with outrageous audio — bleeps, crickets, white noise, space popcorn, and more! This demo program will show you how to get the most from your Apple II speaker.

► **System Software 5.0:** You say you want a revolution? Well, system software v. 5.0 delivers. Sandy Mossberg, *Nibble's* venerable programming expert, will show you how and why.

► **ProDOS Disk Doctor:** Put on your lab coat for a close look at the disk operating system. You can use this powerful medicine to salvage lost files, diagnose bad blocks, and perform "exploratory surgery."

► **Apple Split Screen:** Quit scrolling through endless BASIC listings. This program lets you view — and edit — in two places at once!

THE FEBRUARY 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. *Nibble's* February 1990 programs are available on a single disk for an introductory price of \$12.95 from *Nibble*, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 4/30/90; after that date, the price will be \$16.95. See the *Nibble* Software Directory in this issue for ordering information. **ORDER NO.: W28**

GALE! The Ultimate Applesoft Editor

(Global Applesoft Line Editor)

10 Reasons to Buy GALE

GALE is a specially-designed word processor for writing or typing Applesoft program lines. It is an indispensable assistant that helps you:

1. Make programming fun! Your typing errors can be corrected instantly, a line at a time, using a couple of keystrokes. Automatic Insert, Delete, Zap, Restore, Find and Replace make it easy, like word processing.
2. Edit really BIG programs. GALE moves itself into upper memory and doesn't take up program space.
3. Avoid conflicts between variable names. Find out which variables you've used and where — with instant cross-referencing.
4. Open up space for program changes. Automatic program line renumbering does it fast — for the whole program or within the program.
5. Cut typing — dramatically. Assign frequently used commands to single keys. Customize your own keyboard! And GALE already has a bunch of built-in shortcuts for functions like CATALOG, LIST, etc.
6. Use common routines without retyping. GALE's merge feature joins programs painlessly.
7. Get the facts! Program pointers, free disk space, lengths, free memory, variable space and more are all available with two-key display commands.
8. Get quick references — with built-in HELP screens.
9. Back it up — GALE is not copy-protected.
10. It includes a 67-page manual with sample sessions.

GALE works with ProDOS and DOS 3.3 on Apple IIc, IIe, and IIGS systems. And you get an unconditional, 45-day money back guarantee. You'll wonder how you got along without it.

GALE - The word processor for Applesoft programs.

I want GALE! Here's my \$49.95

C1

Name _____	
Address _____	
City _____	State _____ Zip Code _____
I've enclosed a check or money order <input type="checkbox"/> Charge my: Visa <input type="checkbox"/> MasterCard <input type="checkbox"/>	
Credit Card Number _____	Expiration Date _____
Signature _____ Telephone Number _____	
MindCraft Publishing Corp., 52 Domino Drive, Concord, MA 01742 or call: 1-800-888-1660	
Shipping: Add \$2.50 shipping & handling within the U.S. and Canada. Add \$7.50 shipping & handling for Overseas Air Mail. Mass. residents add 5% sales tax. Payments must be in U.S. funds only.

MODEM MGR® \$49⁹⁵

plus \$3 ship/hand • plus tax (Calif. only)

- A powerful telecommunications program
- For Apple IIGS, //c, //e,][+
- Runs most internal and external modems
- Text capture and auto disk save
- Screen capture (snapshot)
- Full-screen editor
- Full- or split-screen display with type ahead (for CB, chat, packet radio)
- Macro script files for auto log-on
- Programmable function keys
- XMODEM and BINARY II file transfers
- Fast operation (110 to 19200 baud)
- Both ProDOS and DOS 3.3 support
- Supports Apple or Videx 80-column card
- On-screen display of time-of-day or elapsed time (with most clock cards)
- Unattended mode with password protection
- Emulates DEC VT52, DG D200, others
- ★ NEW for IIGS, //c, 128k //e (ProDOS):
- ★ DEC VT220, VT100 emulation
- ★ Reverse scroll review
- ★ Message flagger for easy retrieval
- Available direct only. Send check to:

AVOIDING MORE BUGS

Ready for another bug-hunting expedition? Ideally, we would never have to locate and kill program bugs. But in the real world, bugs are an integral part of the life of any computer programmer. The disk operating system (DOS 3.3 or ProDOS) is quite communicative, and its error messages, while not exactly welcomed by programmers, do a pretty good job of pointing out the problems.

DISK ERRORS

Let's consider a group of errors that, at best, can be called careless. These are the operator errors caused by a failure to satisfy the basic requirements of the operating system. You are the source! DOS 3.3 or ProDOS error messages tell you the nature of the problem, just as the Applesoft error messages do. (DOS error messages lack the question marks that precede Applesoft error messages.)

WRITE PROTECTED appears when DOS tries to store information on a locked disk. A 5.25-inch disk is locked by covering the write-protect notch with an adhesive strip. A 3.5-inch disk is locked by sliding the write-protect switch so that the write-protect hole is open.

If you try to read a disk but forgot to insert one in the selected drive, the I/O ERROR message is displayed. There are other conditions that cause the I/O ERROR message: The door on the disk drive left open; the disk in the drive is damaged or not formatted correctly, and so on.

As in Applesoft, if you try to use a command in immediate execution mode (from the keyboard) that isn't intended for immediate execution, NOT DIRECT COMMAND reminds you.

By their nature, operator errors are relatively easy to correct. The solution to most of the errors noted here is simply to remedy the condition and try again. Although I'd like to be able to tell you it gets better with experience, I still leave the disk drive door open,

DOS
helps
clear
the
error

Keys to Bug Squashing

1. Anticipation. You must learn to anticipate and make provisions for hardware-related problems such as disk full, etc.
2. Proofreading. Since most errors are typographical, proofreading helps reduce their number significantly.
3. Experience. There's no substitute for it. You must learn which areas are likely to give you problems and monitor them carefully.

Disk Error Messages

WRITE PROTECTED
NOT DIRECT COMMAND
SYNTAX ERROR
FILE NOT FOUND
FILE LOCKED
DISK FULL
RANGE ERROR
VOLUME MISMATCH
PATH NOT FOUND
END OF DATA
NO BUFFERS AVAILABLE
FILE TYPE MISMATCH
PROGRAM TOO LARGE

Leslie R. Schmeltz, 3224 Magnolia Court, Bettendorf, IA 52722. This program will run under DOS 3.3 and ProDOS. Hands On Applesoft is excerpted from the book Hands on Applesoft, published by MindCraft Publishing Corp.

insert disks upside-down, forget to format disks, and, as a result, periodically get to see all the error messages I've just mentioned.

Play it Again, Sam!

Even though you've heard of a SYNTAX ERROR before, you'll encounter it again in disk operations. Each time you make a grammatical error in a disk command, the ever-popular SYNTAX ERROR appears.

When a disk command specifies a file that is not on the disk catalog, a FILE NOT FOUND error is generated. If you fail to type the name of a file exactly as it appears in the catalog, this error message reminds you. Of course, you might have accidentally deleted the file or changed disks.

Write operations are not permitted to locked disk files. Locked files are identified by an asterisk (*) preceding their name on the disk catalog. If you try to WRITE, RENAME, SAVE, BSAVE, or DELETE a locked file, the DOS error-trapping mechanism will generate a FILE LOCKED message.

If your disk has no more room but you attempt to store additional data, you will see a DISK FULL error message. This creates an interesting problem in that a portion of a file might be saved before this message is displayed. Cataloging the disk shows the file name, but not all the information is included in the file. Before attempting further operations, DELETE the incomplete file and save another copy of the original on a disk with more room.

Ridin' the Range

If your Apple could strum a guitar and yodel (we could call it Slim Bitman!), you might hear something like this coming from the computer some night:

Don't tell me a slot where a disk drive is not.
Or a volume that doesn't match up!
Watch your values of B, R, L, and A.
And my disks will read and write OK!

The lyrics may be corny, but the advice is valid. The slot number, for example, must be from 1 to 7, and the disk drive number either 1 or 2. Specifying a slot or drive outside the permissible range results in the RANGE ERROR message. It is possible to get into trouble with a perfectly legal command (at least in terms of range), but we'll cover that state of affairs in the next installment.

Values of B (byte), R (relative or absolute field for sequential access files, record number for random-access files), and L (record length for random-access files or number of bytes for binary files) should not exceed 32767. Except for record length (which is 1), the minimum acceptable value is 0 (zero). A, the starting address for a binary file, can range from 0 to 65535. (B and A have specialized uses that are beyond the scope of this article.)

Under DOS 3.3, volume numbers from 1 to 254 can be assigned to disks during the initialization process. If the volume specified in a disk command does not match the volume assigned to a specific disk, the VOLUME MISMATCH message appears. Volume numbers outside the 1 to 254 range usually cause the RANGE ERROR message.

Now come the exceptions. (You knew this was coming, didn't you?) Specifying a slot number from 8 to 16 in a program line will result in the SYNTAX ERROR message, rather than the RANGE ERROR you would expect. Similarly, any disk command parameter or command quantity less than 0 or greater than 65535 triggers the SYNTAX ERROR message. Oh well, nobody said this was going to be easy!

AND MORE BUGS

As you might have guessed, we have not yet exhausted the full list of disk error messages. They have been listed in decreasing order of their appearance in the normal course of programming operations. Bear with it a while longer, while we discuss the rest of the little rascals.

END OF DATA occurs when you try to retrieve more information from a file than was stored in it initially. This message is displayed after an INPUT or GET statement, and often is the result of a failure to reset the file pointer.

NO BUFFERS AVAILABLE is displayed when another file buffer required for input or output operations is not available. (A buffer is an area of memory that is set aside to hold data as it is transferred to and from the disk.) It normally occurs in a program when you have forgotten to CLOSE a series of files after OPENing them.

FILE TYPE MISMATCH is caused by an incorrect combination of a disk command and existing file type. You won't get away with trying to BRUN an Applesoft program file or LOAD a binary file. Check the disk catalog for the letters that identify the file type to avoid this problem.

PROGRAM TOO LARGE is displayed when a disk command attempts to RUN a program that is too large for the available memory.

SUCCESSFUL BUG SQUASHING

The errors we've discussed here can be eliminated using a process similar to the one outlined in the last article. First, determine the source and nature of the problem. Error messages are designed to give you at least a rudimentary clue about what is wrong. In a majority of cases, an examination of the offending line or statement will quickly reveal the source of the error.

Some problems, such as DISK FULL, are not directly related to program lines but reflect hardware considerations that need to be kept in mind during program operation. The key to eliminating hardware-related problems is anticipation. Change the disk before it gets full, be sure the drive is set up properly, and so on. While you can correct a problem after an error message is displayed, anticipating conditions that could precipitate errors is far more efficient (and satisfying).

If you have done your homework while learning storage operations, you know to dot your I's and cross your T's. Once you know the correct format and syntax requirements of specific commands, spotting errors becomes a relatively simple matter. A key to avoiding them is careful proofreading.

Another key to avoiding errors is experience. After a while, common problems will become quite familiar. You might find, for instance, that your most troublesome statements are contained in the creation and handling of random-access files. If so, it would seem logical to spend some extra time carefully examining and troubleshooting those types of statements. Experience points out strengths and weaknesses. Learn to eliminate your programming weaknesses, and errors will disappear like magic.

WRAPPING UP

The solutions to most of the problems covered so far are simple. If they're so simple, you say, why have we spent two chapters discussing bugs?

Last month, this series covered language-related errors. Together with the disk errors, they form a group of bugs we could loosely classify as pilot error. If you have ever heard reports of plane crashes, you know that pilot error is used to cover a multitude of sins not directly attributable to the aircraft. In other words, if the engines ran properly and the radios transmitted, all else must be the fault of the pilot. Computer programming is not really that different. If the hardware works correctly, any other problems are the fault of the programmer.

But before you get a large complex, let's make it clear that not all errors are pilot error — just the vast majority. Another group, called process errors, are much subtle, and difficult to detect. But enough bad news for now. I am reminded of a cartoon character popular a few years ago. Do you remember the fellow with the black cloud over his head in Lil' Abner?

I know just how he felt!

by Donald W. Miller Jr., M.D.

Stranded

Strand or Be Stranded

You and your archrival are stranded on a tropical isle. You each have an unlimited supply of secret anti-matter bombs, which will disintegrate the land, leaving only sea remaining.

It is your mission to isolate your enemy on a quadrant surrounded completely by water. Without an escape, your archrival can easily be captured.

Keep this in mind, and you're ready to play the Lo-Res strategy game, *Stranded*.

USING THE PROGRAM

The Lo-Res playing field consists of 48 "land" quadrants surrounded by a blue sea. Two people can play against each other, or just one can play against the computer. To play against the computer, enter APPLE when asked for players' names.

The program will request a skill level for the Apple. At level one, the computer makes random moves and isn't too smart. Level two is about average; it plays a nice game. Level three is tougher than two, but probably only slightly harder than playing a human. And level four is the most difficult.

Initially, players are placed at opposite ends of the "isle." Each is asked which quadrant to "bomb," choosing from any on the field. The idea is to limit, either immediately or eventually, your opponent's movement.

The quadrants are labeled by their axes; the computer accepts first the X, then the Y coordinate. (For example, enter 1, then 3, for quadrant (1,3)). All invalid entries will be greeted with a bell.

Donald W. Miller, Jr., M.D., 734 Lake Ave., Racine, WI 53403. This program is compatible with DOS 3.3 and ProDOS.

Next, you must move to an adjacent quadrant. The move is entered as before.

Again, the idea is to avoid being cornered, to achieve greater mobility.

The game proceeds in this way until one of the players has no more moves. The Apple signals the end of the game and politely asks if another is desired.

ENTERING THE PROGRAM

Type in the Applesoft program from Listing 1, STRANDED. Then save it to disk with the command

SAVE STRANDED

For help with entering *Nibble* listings see the Typing Tips section.

HOW THE PROGRAM WORKS

Two methods of labeling the 48 squares were used. The first method labels each square sequentially from 1 to 48 (SQ), and the second labels a square according to its X and Y coordinates (X,Y). Variables were designed to translate from one system to the other (SQ=SQ(X,Y), X=X(SQ), Y=Y(SQ)).

The squares also are assigned a value of 1, represented by the variable V(SQ). When an individual square is bombed or occupied by a player, the value is changed to 0. This allows the computer to determine valid moves from a particular square.

The most extensively used subroutine starts at line 90; you might call it FIND. Basically, FIND takes a square and checks the value of the eight surrounding squares. Some of the surrounding squares can be phantoms — they do not exist — but by default their value is 0.

The subroutine tallies all possible moves from an individual square and identifies each of them for future use. Also, by checking one of the counters (CT), FIND determines a winner. If CT=0, no moves are possible.

In summary, a particular square's number (SQ) is input, and the moves from that square (PM()) are generated and counted.

The program's strategy is to define the best move as the one that has the most possible future moves. It follows that the square to "bomb" is the opponent's best move. It bombs that square. Then the Apple chooses its own best move and makes it.

Level one uses FIND to locate all the possible moves (or blocks) and randomly picks one of these.

Level two goes a step further. It, too, finds the possible moves, but instead of blindly choosing one, it puts each into FIND. So, the possible moves after each of the initial possible moves are found and tallied. Confused? This is just a loop two levels deep.

Now the Apple has the information to make a more intelligent decision. It will choose the initial move that has the most possible future moves. Often, several of the possible moves are equally good at two squares deep. At level two, the Apple randomly chooses among these.

Level three goes yet another step. Instead of choosing randomly from the good moves generated by level two, it puts them into FIND, which selects the best. Again, several initial moves may be equally good, and only then does level three randomly choose one of them.

The actual code for game play is contained in lines 90-540, and the instructions are contained in lines 1030-1100.

I've incorporated two programming tricks you might want to use in your own programs, and both involve graphics.

Instead of switching to the Lo-Res screen and watching as each part of the field was drawn, the numbers added, and the players generated, I wanted a more "classy" presentation. Using various graphic soft switches, the blank Hi-Res screen is displayed while the game board is invisibly drawn on the Lo-Res screen in lines 740-880. The game board appears only after it is completely drawn.

Some of the same soft switches are used at the end of the game

by rapidly alternating between the Lo-Res graphics screen and the text screen, as in lines 970-990.

For more information on these switches, refer to the Applesoft manual.

MODIFICATIONS

One modification that comes to mind immediately is to upgrade the graphics from Lo-Res to Hi-Res. Perhaps you could define an intricate shape table to define the players. Or maybe you would want to put in some obstacles, like a shark that moves around. But these changes are merely cosmetic. Once you get good enough at the game, you might want to improve the computer's movement algorithm. This should present an excellent challenge since it is already very difficult to beat the Apple at level four.

THE FEBRUARY 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. *Nibble's* February 1990 programs are available on a single disk for an introductory price of \$12.95 from *Nibble*, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 4/30/90; after that date, the price will be \$16.95. See the *Nibble* Software Directory in this issue for ordering information. ORDER NO.: W28

See Nibble Run...

On YOUR Apple... every month.

Just slip the new Nibble disk into your Apple and you're ready to run — with original new programs to organize your home finances... boost your personal productivity... educate you and your children... dazzle you with graphics... increase your programming power... entertain you endlessly. It's a perfect complement to your Nibble magazine.

Subscribe and Save 42%

The monthly Nibble disk has every program from the current issue. And you can start your Nibble Disk Subscription for as little as \$8.33 per month. You'll save a big 42% off the single-disk price.

Experiment... and learn

Nibble disks are not copy-protected, so you can experiment with a broad range of new programs and utilities. Whether you're a beginner or an experienced owner, you'll discover even more about your Apple II and what it can do.

Your Satisfaction is Guaranteed

You can't find a better value for Apple II software... anywhere. We're so convinced of this, that we'll refund your money for any unmailed disks if you aren't satisfied.

It's easy to bring the world of Nibble computing to your Apple each month, and to...

See Nibble Run!

Sample programs from past issues

Send to:

nibble Disk, 52 Domino Drive, Concord, MA 01742

Or call (800) 888-1660 (9 am - 5 pm EST)

YES! I want the convenience of **nibble** programs on disk. Please start my Nibble Disk Subscription for the term I've checked below:

- ☐ 6 MONTHS — \$59.95 ONLY \$9.99 EACH! ☐ Payment enclosed (check or money order)
☐ 12 MONTHS — \$99.95 ONLY \$8.33 EACH! ☐ Credit card: ☐ VISA ☐ MasterCard

Name _____ Card # _____ Exp. _____
 Address _____ Signature _____
 City _____ State _____ Zip _____ Tel. () _____

*The disk subscription does not include documentation. Magazine must be purchased separately.

For Canadian orders: Add \$4 for 6 months; \$8 for 12 months. For orders outside U.S. and Canada: add \$12 for 6 months; \$24 for 12 months. Payment in U.S. funds drawn on U.S. bank only. Massachusetts residents add 5% sales tax.

DSAD

Thanks for the memory.

UniDOS Plus allows thousands of DOS 3.3 Applesoft programs and data files to run with large-capacity 3.5-inch disks. The 3.5-inch disks have five times the storage capacity of floppy disks — but Apple's older DOS 3.3 cannot access them. UniDOS Plus fills this gap. With UniDOS Plus, you get DOS 3.3 compatibility and a big 800K capacity!

More Memory Too!

You get 24% more memory for your programs and data — without hardware! UniDOS moves DOS 3.3 out of program memory and into auxiliary RAM... and adds nearly 9,000 bytes to Applesoft program space. You'll write bigger, more powerful programs that used to be impossible.

Still More!

You get these exciting features too.

- ▶ The first FAST COPY for 3.5-inch disks!
- ▶ Wildcard Catalog commands.
- ▶ Intermixed 3.5- and 5.25-inch disks.
- ▶ Two 400K volumes per disk.
- ▶ Up to two 3.5-inch drives (1.6 megabytes) per slot!

Order now to get BIG DISK capacity and BIG MEMORY in one powerful package!

System Requirements.

UniDOS Plus runs on any Apple II series computer and is compatible with: Apple UniDisk 3.5, Apple 3.5-inch disk, and the Chinon 800K disk with Central Point's Universal Disk Controller card.

UniDOS Plus works with all Applesoft programs, but doesn't work with many copy-protected or commercial programs.

I want UniDOS Plus! Here's my \$39.95 (C22)

GS ALARM

The idea for GS.ALARM surfaced one day after I missed 45 minutes of a Pistons-Celtics game. I had intended to use the computer for only 30 minutes, but you know how time accelerates when you sit down at the keyboard. The next thing I knew, an hour and 15 minutes had elapsed; I decided to get an alarm program for my IIGS that would work while in BASIC.

I searched but couldn't find what I wanted — that is, a program to remind me of terribly important appointments or events, such as Pistons-Celtics games, that I might miss because of Computer Accelerated Time. So, I wrote GS.ALARM.

Your
first
defense
against
computer
stupor

USING THE PROGRAM

To run GS.ALARM, boot your computer with ProDOS, insert the disk containing the GS.ALARM file and, at the BASIC prompt, type

```
BRUN GS.ALARM
```

The screen will clear and you will be reminded that the IIGS clock must be in AM/PM format. Use the IIGS Control Panel to determine your setting.

Next, you will be prompted to enter your appointment time. You must enter the time in the proper format. If the hour is a two-digit number — say, 11:45 in the morning — then enter 11:45 AM. If the hour is a single digit number — for example, 9:45 in the morning, then enter 9:45 AM. One space is required between the last digit of the time and AM or PM. Press Return.

If you want to quit GS.ALARM without setting an alarm, press Control-Q and Return. Control-Q must be the first character you type. If you start to enter a time and decide to quit, move the cursor back to the first character position, press Control-Q, then press Return.

Elwood J.C. Kureth, 48251 N. Brooks, Mt. Clemens, MI 48045. This program requires a IIGS and ProDOS.

The next prompt verifies the time you've entered. If the time is correct, type a Y (upper- or lowercase) and press Return. If the time is incorrect, type N, press Return, and enter the correct time.

Next, you'll enter your alarm message. It can be as long as 160 characters, or four screen lines in 40-column mode. If you enter more than 160 characters, you will get a fast, unreadable screen when your message is displayed.

If you don't want to enter a reminder, you can quit the program by pressing Control-Q and Return. Otherwise, edit your message and press Return. Answer the prompt, press Return, and the screen will clear. You will then find yourself back in BASIC. Your message will be displayed and an alarm will sound at the time you've set. Press Return twice and you will return to the BASIC prompt.

A minor inconvenience of GS.ALARM is that if your message flashes on the screen when you are typing a BASIC line, you will lose that line.

If you want to run GS.ALARM after you've set an alarm, simply type CALL 36865 at the BASIC prompt. If your previous alarm setting has not been activated, you will see a message on the screen indicating that you've set an alarm. It will show you the current alarm time, and ask you if you want to set a new alarm time. If you type Y you have a chance to set your new alarm time and new message and return to BASIC.

Control-Reset: Warning

Control-Reset disconnects GS.ALARM, and any message you have entered will be lost. If the situation requires a Control-Reset, be sure to run GS.ALARM again by typing CALL 36865 at the BASIC prompt.

The alarm set message will appear on the screen, showing you the alarm time and asking you if you want to set a new one. *Always*

type Y after a Control-Reset, and enter the alarm time and message. Otherwise, nothing will happen because your alarm has been disconnected and your message destroyed by the Control-Reset.

The trick to GS.ALARM is one of many IIGS interrupt sources

ENTERING THE PROGRAM

If you have an assembler (Merlin 16 was used here), type in the source code from Listing 1, assemble it, and save the object code with the filename GS.ALARM. If you do not own an assembler, enter the Monitor with

CALL -151

and then type in the hex codes from Listing 2. Now save the file with

BSAVE GS.ALARM, A\$9001, L\$456

For more help with *Nibble* listings, see the Typing Tips section in this issue.

Your Apple Games Gallery...

■ Challenges the far reaches of outer space with the arcade excitement of *Quasar II*. ■ Tickles your kid's mind with educational adventures like *Mathemagician* and *Math Concentration*. ■ Takes you on perilous quests for fortune and fame with *Idol of Monterey*. ■ Deals a big hand of excitement with *Nibble Blackjack* and *Bridge Bidder*. ■ Puts you in command with *Artillery Duel* and *Surprise Attack*. ■ Brings home your arcade fun with *The Nibbler* maze and *Major Mayhem*.

Your Apple Games Gallery has these and more of our very best games to entertain you, tease your imagination, and challenge your playing skills.

you'll flip out!

with the best games collection of the decade!

HOW THE PROGRAM WORKS

GS.ALARM's logic is straightforward. The key is the IIGS clock. You enter a time (in AM-PM format) and a message (as many as 160 characters) that are stored in memory as ASCII values. GS.ALARM then calls a tool known as ReadTimeASCII from the IIGS toolbox. This tool stores the date and time in memory as a string of ASCII characters. GS.ALARM then checks the entered time with the IIGS time. If they match, an alarm goes off and your message appears on the screen. If no match is detected, GS.ALARM calls ReadTimeASCII for another check, saves the time, and compares it again to the alarm time. This sequence, which takes place in milliseconds, is repeated until the alarm time and IIGS time agree.

The trick to making GS.ALARM work is using one of the many IIGS interrupt sources. An interrupt is usually caused by an external signal that tells the computer to stop what it's doing and pay attention to a more important task.

In the case of GS.ALARM, I used the clock chip interrupt source. A one-second timer interrupt is generated by the 1-hertz signal from the clock chip. The interrupt is enabled by setting a bit in the Video Graphics Controller (VGC) register. Now, once a second, the system will jump out of the BASIC system environment in which you're programming and go to the user interrupt vector, which contains the address of GS.ALARM's main routine. The system goes to that part of memory and executes the routine that compares the times.

After a single comparison, GS.ALARM performs an RTI (Return from Interrupt) back to the BASIC system (unless there is a match, at which point GS.ALARM jumps to the message routine). It's this jumping back and forth that lets you program in BASIC as the time check is made. All this transpires so fast you'll never notice it's working.

GS.ALARM checks your entry for the correct format and char-

acter validity and position. GS.ALARM does this by checking each character or characters in the time string against characters valid for that position.

In lines 166 to 170, GS.ALARM checks the second digit of the minutes. This number can only be in the range 0 to 9. So, the program first makes sure the number is not less than 0 — that is, it doesn't have an ASCII value of less than 48.

If the character's ASCII value is less than 48, it's not within the range of acceptable characters and GS.ALARM asks you to re-enter the time.

If the ASCII value is greater than 48, GS.ALARM checks to determine if it's greater than 57, the ASCII value for 9. If it is, you're forced to re-enter the time.

In line 169, GS.ALARM uses a colon (:) as a comparison character. This is because the Branch on Plus (BPL) instruction in line 170 will execute if the ASCII value in the time string is greater than or equal to the compared value. If we used the number 9 for the comparison, the re-enter message would be displayed whenever you entered a 9 at that position, even though it is a valid character for that spot.

To make the check function correctly, the program uses the character that has the next highest value in the Apple character set, which is the colon. The colon has an ASCII value of 58.

THE FEBRUARY 1990 DISK CONTAINS THIS PROGRAM

If you'd rather not type in the listing for this program, you can buy it on disk, complete, free of typos and ready to run. Nibble's February 1990 programs are available on a single disk for an introductory price of \$12.95 from Nibble, 52 Domino Dr., Concord, MA 01742. Add \$2.50 for shipping/handling within the U.S. and Canada; \$7.50 for overseas air mail. Introductory price expires 4/30/90; after that date, the price will be \$16.95. See the Nibble Software Directory in this issue for ordering information. ORDER NO.: W28

Now Serving

The Best of Nibble '88 in a Big New Anthology!

Nibble Express IX is a MUST for your Apple II library. The editors have handpicked the very best programs, utilities, and tips & techniques from *Nibble* 1988 for your collection. You'll get programs for poster-making, desktop publishing, charting, painting, game-playing, and even creating music! Every program is complete and ready-to-type and run on your Apple IIc, IIe, or IIGS.

If you're new to *Nibble*, the *Express* is perfect for catching up on the top features from past issues. If you're already a *Nibble* subscriber, you'll be delighted to have your favorites collected in one convenient volume, with the most current, updated program listings. Here's a sample of the nearly 30 great features:

- **Poster Creator** — Crop, size, and turn your graphic screens into GIGANT poster art on any printer.
- **ChartWorks** — Add a new dimension to AppleWorks and chart your spreadsheets with this handy utility.
- **File Revival** — Recover deleted ProDOS files with ease.
- **PrintWorks** — Make amazing displays with proportional spacing, inverse printing, or wavy lines — total screen control.
- **QuickWriter** — The convenience of an electronic typewriter at your fingertips for envelopes, memos, and short typing jobs.
- **SpeedDraw** — Pie charts, spirals, curves, really CAN be easy.
- **Applesoft Matchmaker** — Wondering what's changed from one program version to the next? Matchmaker tells all.
- **Games** — You'll get super games too... like Chinese Checkers, Zapz, and City Centurian.

You get these and many more of *Nibble*'s best programs in this big 176-page anthology.

Nibble Express IX

Whether you're creating a newsletter, making a presentation, or just having fun, you'll have hours of enjoyment with the *Express*. It is one of the best collections of Apple II programs and tips you'll find anywhere.

Order YOUR Express IX Today!

Nibble Express IX. Item # B9: . . . \$19.95 plus shipping.

To order, use the Nibble Products Order Card in this issue, or send your check or MasterCard or Visa authorization to:

Nibble Express,
52 Domino Drive, Concord MA 01742
or call 1-800-888-1660 for credit card orders.

Please allow four to six weeks for delivery.

Shipping — \$3.00 U.S. & Canada, \$6.00 Overseas surface, or \$9.00 Overseas air. Payment must be in U.S. funds. Mass residents add 5% sales tax.

What's the value of a new idea?
A new idea is rare. . . and sometimes even priceless.

IDEAS → POWER

The Third Book of Apple Secrets is loaded with new ideas... tips, techniques, and short programs that unlock the power hidden within your Apple II.

This new, carefully-selected collection of the best Tips and Techniques from *Nibble* magazine will make your Apple do things you never thought possible... with just a few minutes of your time. And you won't find them anywhere else!

Speed and Power

Experts reveal the secrets they use to increase the speed of their BASIC programs by up to 300%! And you'll see how to build bridges between BASIC and Assembly Language for really amazing speed.

Graphics Galore

Discover the ZOT, a dynamic graphics character with amazing versatility. See how 3-D graphics work — and find out how to swap graphics fast, or how to put Double Hi-Res characters on your graphics screens.

Windows and Text

Tap the power of text screen windows (like the Macintosh) and do it with Applesoft. You can even make AppleWorks-like menus work with your machine-language programs — or use a mouse to control your own program menus.

Automatically format your text screens with word-wrap, page breaks, and upper/lowercase conversions — a little program does it. And another counts the words in your text files.

Programming Made Easy

Let's face it, everyone makes errors in programming. You'll get a short but powerful Error Lister that reveals not only the line where the error occurred, but the statement that caused it. Or you can use the Poor Man's Line Editor to correct errors with ease.

Dabbler or Expert

Whether you're an expert or just learning how to program, *The Third Book of Apple Secrets* is an invaluable addition to your library.

Each of the more than 40 secrets is a new foolproof method for streamlining your Applesoft and machine language programs. The authors give detailed descriptions of the programs, so you see how they work. And the demonstration programs show you how to use the techniques yourself.

And you can also get all the programs from *The Third Book of Apple Secrets* on disk!

It takes only a few minutes to put the power of new ideas to work in your Apple.

P.S. If you want even more ideas, don't miss the first two volumes: Apple Secrets and More Apple Secrets, advertised in the Nibble Library in this issue.

Shipping and Handling: \$3.00 in the U.S. and Canada. Add \$6.00 Overseas Surface. Add \$9.00 Overseas Air Mail. Payments must be in U.S. funds drawn on a U.S. bank. Massachusetts residents please add 5% sales tax.

GET

24% MORE MEMORY

without hardware

It seems incredible — but it's true. No matter how much physical memory your Apple II system has, your AppleSoft programs and data can use only 36K...until NOW. ProHigh is a remarkable software product that adds nearly 9,000 bytes to useable Applesoft program space.

DOS 3.3 / ProDOS

36K
Free Program
Memory

System Storage

Without ProHigh

45K
Free Program
Memory

System Storage

With ProHigh

► Bigger Programs and Data

With ProHigh, you can:

- Write larger, more powerful programs that used to be impossible.
- Hold a lot more data in memory
- Avoid the dreaded OUT OF MEMORY message.
- Design exciting graphics programs by using the added memory as an extra Hi-Res graphics page!

► How Does It Work?

ProHigh works its magic effortlessly, with all Apple II series computers that have at least 64K of memory. It lifts the program memory restriction by moving the Disk Operating System (DOS 3.3 or ProDOS) out of program memory and into auxiliary RAM. It's as simple as booting the ProHigh disk. And your programs use the 9K of added memory automatically! (Note: With the Apple II Plus, ProHigh relocates DOS 3.3 but not ProDOS.)

Get BIG MEMORY NOW! with ProHIGH!

I want ProHigh! Here's my \$29.95 (C33)

Add shipping & handling \$2.50 U.S. & Canada — \$7.50 Overseas Air Mail. Mass. residents add 5% sales tax. Payments must be in U.S. funds only.

Be Cool

Conserver™. The Integrated Disk Drive Organizer/Switched Power/Cooling Fan

Heat is your computer's most insidious enemy. Peripheral cards allow you to do wonderful things with your computer, but they unavoidably produce heat inside your cpu. Load a IIGS with several peripheral cards and that heat is multiplied. Heat-related failures become a real (and devastating) possibility.

Conserver™, from Applied Engineering, effectively cools your IIGS while it protects against power surges and helps organize a cluttered work-space.

Conserver's quiet but powerful cooling fan efficiently maintains a safe operating temperature at all times. Drawing air from the top of the IIGS at a rate of 18 cubic feet per minute, Conserver offsets the heat produced by expansion cards. In fact, tests show a IIGS operates more than 20 degrees cooler with a Conserver than without. The difference can be critical to the life of your computer.

Power surges are another invisible risk to your computer's well-being. Power surges occur when voltage spikes surge through your wiring looking for a place to dissipate. If that place is inside your computer, you'll very quickly gain a greater understanding of the laws of electricity. It's not a pretty sight.

Conserver incorporates special line

conditioning filters and dual surge suppression circuitry to protect against surges, reduce noise and provide "clean" power. Six switched AC power outlets line the rear of Conserver to

perfectly matched platinum color. To reduce desktop clutter, the unit was cleverly designed to house two 3.5" disk drives, or one drive and the special diskette holder we include.

Conserver. The cool, safe choice to protect your IIGS from its invisible enemies.

Conserver \$99

Order Today!

To order or for more information, see your dealer or call (214) 241-6060 today, 9 am to 11 pm, 7 days. Or send check or money order to Applied Engineering. MasterCard, VISA and C.O.D. welcome. Texas residents add 7% sales tax. Add \$10 outside U.S.A.

accommodate your computer, monitor and four other peripherals. Thus protecting your computer and your peripherals from surges. The outlets are conveniently controlled by three front-mounted switches with LED indicators.

For beauty, we gave Conserver the same sleek lines of the IIGS and a

Nibble Express just keeps getting bigger!

That's because each year the editors of Nibble magazine find more great programs for you and your Apple II computer.

Each Nibble Express is a softcover book packed with the best programs and articles from a full year of Nibble. Dozens of fun, informative and useful programs to type into your Apple II, II Plus, IIe, IIC or IIGS. So many, in fact, you'd have to pay over \$600 for the programs from just one volume if you bought them on disk. Compare that to the price of a single volume of Nibble Express — just \$7.95-\$19.95!

Learn the fastest, most powerful language for the Apple II!

The Beginner's Guide to Apple II Assembly Language teaches you the nuts and bolts of assembly language programming.

You'll learn how to write fast, flexible routines. The type of routines that put the punch into stunning graphics, gorgeous sound and superfast arcade games. And learning is easy, because the book uses analogies to the language you already know, Applesoft BASIC.

The Beginner's Guide to Apple II Assembly Language is a collection of all twelve installments of Nibbling at Assembly Language, updated for the IIGS.

A.L. Programmer's Disk

You can also order The Beginner's Guide Programmer's Disk. Over 30 full-length example programs from the book will help you zoom through calculations and make fast hex-dec conversions. Or add instant sound effects and music to your programs — the routines are here, ready to use!

Yes! I want to learn assembly language. Send me:

Y MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MONEY MO

Making Money is hard... Keeping it is even harder!

Money! You earn it. You invest it. You spend it. You try to save it. And you wonder where it goes.

Thousands of books have been published that tell you about money management. Your Apple Money Manager is a unique collection of personal finance programs that help you *actually* do the job.

Each program has easy step-by-step instructions for putting it into your Apple IIc, IIe, or IIGS and using it. And you don't have to know programming to put Your Apple Money Manager to work. Here are some highlights:

- **The Investor** uses powerful graphics to chart short/long term trends with clear buy and sell signals. Includes five different reports.
- **The Five Minute Financial Planner** is an AppleWorks spreadsheet that helps you manage household income and expenses.
- **AppleWorks Bar Charts and Plot** adds graphing and charting to your spreadsheets and databases.
- **The Banker** records and codes checking transactions, helps balance your checkbook, and prints expense reports for categories that show where your money goes!
- **The Investment Advisor** calculates the return on investment before and after taxes for various time periods. You can measure the bottom-line performance of up to 96 stocks.
- **Credit Card Tracking System** is an AppleWorks instant notification system if your cards are lost or stolen.
- **Nibble Garage** makes scheduling your car care a snap with handy

service reminders.

- **Quick Calendar** gives you an instant, full year calendar for any year that you select.

You get these and twelve more powerful programs and AppleWorks templates in this big 184-page book — everything you need to manage your Shopping... Medical Expenses... Utilities... Time... and Money.

How to Order...

Your Apple Money

Manager costs only \$19.95 plus shipping.

To order, just use the Nibble Products Order Card in this issue, (Reference #B32) or send your check or credit card authorization direct to:

**Nibble, 52 Domino Drive, Concord MA 01742
or call 1-800-888-1660 for credit card orders.**

Shipping — \$3.00 U.S. & Canada, \$6.00 Overseas surface, or \$9.00 Overseas air. Payment must be in U.S. funds. • Mass residents add 5% sales tax.

■ JANUARY 1990 DISK — Line Manager/Over the Rainbow/ASCII File Reader II/Ten Top Tips... Volume 11, Issue #1.

Order No.: **W27**... Introductory price of \$12.95 expires 3/31/90. (New price will be \$16.95).

■ DECEMBER 1989 DISK — Treasure Dive/Free Space/Ticket Kit/Hex File Checker... Volume 10, Issue #12.

Order No.: **W26**... Introductory price of \$12.95 expires 2/28/90. (New price will be \$16.95).

■ NOVEMBER 1989 DISK — Nibble Assembler/Trinum/ Search Sampler/ASCII File Reader... Volume 10, Issue #11.

Order No.: **W25**... Introductory price of \$12.95 expires 1/31/90. (New price will be \$16.95).

For a 90-day period following the publication of each issue, *Nibble* offers the major programs from that issue on disk at nominal "introductory prices."

During the introduction period, products will be shipped without accompanying documentation under the assumption that the buyer has the issue in which the programs appeared. Following the introduction period, the programs will be accompanied by reprints of the *Nibble* articles that documented them.

out the process instantly; just enter the first line number of your program, the line-number increment you prefer, and voila! Line Manager keeps your original program in memory until the new one is created. And if it encounters an error, it leaves your program untouched.

■ **Over the Rainbow** is a very special place. You can see a spectrum in the sky only under certain environmental, atmospheric, and physical conditions. This program, which simulates light rays passing through a drop of water, will help you learn when rainbows are most likely to occur.

■ **ASCII File Reader II** continues the exploration of GS/OS programming by Sandy Mossberg. Learn to create an application window, draw text within it, and dump the screen to the printer.

Order No.: **W27**... Introductory price of \$12.95 expires 3/31/90. (New price will be \$16.95).

DECEMBER 1989 DISK

■ **Treasure Dive** will tantalize the daredevil in you. Chests full of loot lie beneath the waves, but you have to outsmart piranhas, sharks, and deadly ocean mines to reach them. This original, arcade-style game, written in assembly language, will surprise you with its rich sound effects, humorous graphics, and non-stop action. The program has multiple skill levels, and keeps a file of your 10 best scores.

■ **Free Space**, a New Desk Accessory for the IIGS, will see to it you never again play guessing games when saving a file. Just pull down the Apple menu, select Free Space, and you'll get an

to find the typo that slipped by. Just enter the starting address of the program you want checked, and this utility will step through it eight bytes at a time so you can compare the code to the listing.

Order No.: **W26**... Introductory price of \$12.95 expires 2/28/90. (New price will be \$16.95).

NOVEMBER 1989 DISK

■ **Nibble Assembler** is your best alternative to an expensive, commercial assembler. All you need to type in assembly-language programs and routines is this application, a ProDOS-based word processor, an Apple with 128K of memory or more, and a listing.

■ **Trinum**, a Hi-Res game for two or three players, will stretch your advance-strategy skills. You've heard of a love triangle; now play this logic triangle, based on the game TriNim, but intricate and challenging, a rival for Othello and other computer "board" games.

■ **Search Sampler** will show you the difference a binary search can make. Applesoft programs that employ linear searches on large data sets can creep along like cold syrup. This program generates random-number arrays, then uses them to demonstrate the greater efficiency of the binary search.

■ **ASCII File Reader** is Part I of Sandy Mossberg's exploration of a GS/OS Desktop application. This installment deals with the core elements shared by Desktop applications.

Order No.: **W25**... \$16.95 (Introductory price of \$12.95 expires 1/31/90) + shipping

PROGRAMS FROM RECENT ISSUES

Nibble software is inexpensive and easy to use. Each disk contains the major programs from the magazine issue noted. You'll learn a lot about your Apple II and have fun doing it. To place your order:

- Use the handy tear-out order card in this issue to order software, books, and magazine subscriptions or
- Call toll-free 1-800-888-1660 for fastest service. Have your MasterCard or VISA handy and call between 9:00 a.m. and 5:00 p.m. Eastern Time.

HURRY! THESE SPECIAL INTRODUCTORY PRICES ARE IN EFFECT FOR A LIMITED TIME - ORDER NOW

■ **FEBRUARY 1990 DISK** — Real Estate Advisor/Stranded/GS Alarm... Volume 11, Issue #2.

Order No.: **W28**... Introductory price of \$12.95 expires 4/30/90. (New price will be \$16.95).

■ **JANUARY 1990 DISK** — Line Manager/Over the Rainbow/ASCII File Reader II/Ten Top Tips... Volume 11, Issue #1.

Order No.: **W27**... Introductory price of \$12.95 expires 3/31/90. (New price will be \$16.95).

■ **DECEMBER 1989 DISK** — Treasure Dive/Free Space/Ticket Kit/Hex File Checker... Volume 10, Issue #12.

Order No.: **W26**... Introductory price of \$12.95 expires 2/28/90. (New price will be \$16.95).

■ **NOVEMBER 1989 DISK** — Nibble Assembler/Trinum/ Search Sampler/ASCII File Reader... Volume 10, Issue #11.

Order No.: **W25**... Introductory price of \$12.95 expires 1/31/90. (New price will be \$16.95).

For a 90-day period following the publication of each issue, *Nibble* offers the major programs from that issue on disk at nominal "introductory prices."

During the introduction period, products will be shipped without accompanying documentation under the assumption that the buyer has the issue in which the programs appeared. Following the introduction period, the programs will be accompanied by reprints of the *Nibble* articles that documented them.

OUR GUARANTEE

Nibble software is guaranteed to perform as advertised. If you are dissatisfied for any reason, simply return the disk, documentation and invoice to us within 45 days of purchase. We'll refund the full purchase price.

JANUARY 1990 DISK

■ **Line Manager** will spare you from the pain of renumbering Applesoft programs. This amper-sand utility uses the auxiliary memory to carry out the process instantly; just enter the first line number of your program, the line-number increment you prefer, and voila! Line Manager keeps your original program in memory until the new one is created. And if it encounters an error, it leaves your program untouched.

■ **Over the Rainbow** is a very special place. You can see a spectrum in the sky only under certain environmental, atmospheric, and physical conditions. This program, which simulates light rays passing through a drop of water, will help you learn when rainbows are most likely to occur.

■ **ASCII File Reader II** continues the exploration of GS/OS programming by Sandy Mossberg. Learn to create an application window, draw text within it, and dump the screen to the printer.

Order No.: **W27**... Introductory price of \$12.95 expires 3/31/90. (New price will be \$16.95.)

DECEMBER 1989 DISK

■ **Treasure Dive** will tantalize the daredevil in you. Chests full of loot lie beneath the waves, but you have to outsmart piranhas, sharks, and deadly ocean mines to reach them. This original, arcade-style game, written in assembly language, will surprise you with its rich sound effects, humorous graphics, and non-stop action. The program has multiple skill levels, and keeps a file of your 10 best scores.

■ **Free Space**, a New Desk Accessory for the IIGS, will see to it you never again play guessing games when saving a file. Just pull down the Apple menu, select Free Space, and you'll get an

instant report containing the name of each volume (including RAM disks), its capacity, and unused space in kilobytes. Free Space is an assembly-language program, and uses macros to invoke IIGS toolbox routines.

■ **Ticket Kit** will put a nice touch on your next fund-raiser, whether it is a raffle, talent show, or car wash. Just enter the particulars — the event, place, date, time, and price — and this program will design and print as many tickets as you need on an ImageWriter printer. Ticket Kit works with other printers after a few easy modifications.

■ **Hex File Checker** is a machine-language lifesaver. Use it, and you'll no longer have to check machine-language programs byte by byte to find the typo that slipped by. Just enter the starting address of the program you want checked, and this utility will step through it eight bytes at a time so you can compare the code to the listing.

Order No.: **W26**... Introductory price of \$12.95 expires 2/28/90. (New price will be \$16.95.)

NOVEMBER 1989 DISK

■ **Nibble Assembler** is your best alternative to an expensive, commercial assembler. All you need to type in assembly-language programs and routines is this application, a ProDOS-based word processor, an Apple with 128K of memory or more, and a listing.

■ **Trinum**, a Hi-Res game for two or three players, will stretch your advance-strategy skills. You've heard of a love triangle; now play this logic triangle, based on the game TriNim, but intricate and challenging, a rival for Othello and other computer "board" games.

■ **Search Sampler** will show you the difference a binary search can make. Applesoft programs that employ linear searches on large data sets can creep along like cold syrup. This program generates random-number arrays, then uses them to demonstrate the greater efficiency of the binary search.

■ **ASCII File Reader** is Part I of Sandy Mossberg's exploration of a GS/OS Desktop application. This installment deals with the core elements shared by Desktop applications.

Order No.: **W25**... \$16.95 (Introductory price of \$12.95 expires 1/31/90) + shipping

OCTOBER 1989 DISK

■ **Widgets** will challenge your business savvy. You're the president of the company, and your decisions about pricing, wages, advertising, research and development will determine its success or bankruptcy. Widgets combines the fun of a computer game with the lessons of running a small business. The result is an enlightening experience.

■ **GS Startup Screens** will soften the long delay. All you need are these two short programs, and a Super Hi-Res picture of your own creation or choosing. Once you've installed the art — a title screen, perhaps — you'll never have to worry about it again. Every time you boot the disk, your IIGS will display it automatically.

■ **Video/Movie Database** will help you find that certain videotape, even if you don't know its title. Search by actors/actresses, category, year, or director. Video/Movie Database is an AppleWorks application, so you need not be an expert programmer to build it.

■ **Getting the Little Picture** displays a colorful, flying rocket on the Hi-Res screen, but it is capable of much more. Use it to explore the world of Apple II graphics.

Order No.: W24...\$16.95 + shipping.

SEPTEMBER 1989 DISK

■ **DB Construction Kit** simplifies the database creation process. No longer do you have to be a programming genius to build a database dedicated to your task, one that will work more quickly and efficiently than a general-purpose, commercial program.

■ **Wordsearch Wizard** makes building those brainteasers almost as fun as solving them. Just enter in the words you want to "hide," edit them as necessary, and press the Return key. Title the result, and a printout is just another keystroke away.

■ **Appleworks Gradesheet** can be a teacher's (next) best friend. It can manage student records according to name or test score. It can also help you monitor student progress, generate forms for grade entry, and keep track as students come and go.

Order No.: W23...\$16.95 + shipping

AUGUST 1989 DISK

■ **Nibble Number Cruncher**, a powerful, stack-based calculator, performs everything from simple addition to complex statistical and trigonometric functions. Watch it send your work to the printer for an organized, uncluttered printout.

■ **PFX** takes the tedium out of handling ProDOS prefixes. Stop typing in those long pathnames and let this tool select the prefix with just a few keystrokes. It can be used from immediate and deferred modes.

■ **Mr. Clean** makes dirty disk drives a distant memory. Use the simple installer to add the CLEAN command to ProDOS. Insert your cleaning diskette, type CLEAN and presto! No more endless CATALOGing.

Order No.: W22...\$16.95 + shipping.

JULY 1989 DISK

■ **Nibble MenuPro** gives you total control of all your files and directories, enabling you to exercise standard commands from one menu.

■ **Magic Squares** adds a little spark to a mysterious mathematical configuration. Create huge, odd squares with a few simple commands, then use them for games and educational programming.

■ **SuperClock** lets you know the time and date, any time, accessible from any IIGS program.

■ **New Desk Accessories in the GS/OS Environment** explains the essentials of IIGS NDAs, with instructions on building your own System Devices NDA.

Order No.: W21...\$16.95 + shipping

JUNE 1989 DISK

■ **Print Studio** enhances your ImageWriter by letting you create your own custom characters. You can include not only letters and numbers but also special symbols, and mix your new font with the ImageWriter's built-in fonts.

■ **The Exterminators** will pursue you until they liquidate you, unless you get to them first. You can trick them into destroying each other, or use your Sonic Screwdriver to destroy nearby Exterminators.

■ **Mary's Garden** plants flowers, butterflies, and snails on your screen. Your job is to keep track of them before the time runs out.

■ **AppleWorks Automated Check Register** lets you organize your check spending wisely and thoroughly.

Order No.: W20...\$16.95 + shipping

MAY 1989 DISK

■ **Proof** allows you to examine what AppleWorks stores in each spreadsheet cell. This program is a valuable debugging and documentation tool for your AppleWorks spreadsheet files.

■ **Bridges** is a game of clever strategy, with a

golden cup as a prize. If you're careful, you can avoid outwitting yourself.

■ **Get Set with ProDOS** and read and modify information about your ProDOS files — from BASIC. You can adapt these techniques to your own programs.

■ **Investor File Compressor** helps keep your Nibble Investor files current and compact.

Order No.: W19...\$16.95 + shipping

APRIL 1989 DISK

■ **Nibble Launcher**, a powerful Apple IIGS control center, lets you launch programs easily, without opening numerous windows.

■ **Snapshot** prints out Hi-Res pictures vertically or horizontally on your ImageWriter.

■ **Hand Puzzle** challenges your mind and hands to work together to solve this game.

■ **Orbit** allows you to calculate planetary motions and gravitational relationships.

Order No.: W18...\$16.95 + shipping

MARCH 1989 DISK

■ **NibbleCalc** offers you a powerful spreadsheet. Now it's easy to calculate your budget or to work out your taxes!

■ **The Graphics Switcher** converts Super Hi-Res graphics to standard Hi-Res graphics. Enjoy IIGS art on any Apple II!

■ **Works Processor** quickly creates text files from your AppleWorks word processing documents, with or without carriage returns.

■ **Visit Monitor Desk Accessory** helps you explore the mysteries of your Apple IIGS's desk accessories.

Order No.: W17...\$16.95 + shipping

FEBRUARY 1989 DISK

■ **Shape Librarian** lets you more easily work with Hi-Res shapes. This powerful utility helps you combine tables, delete shapes, insert shapes, and more.

■ **OmniType** is a new ProDOS command that quickly shows you the contents of BASIC programs, as well as text, AppleWorks, and other files.

■ **Music Lesson**, a music teacher with infinite patience, makes a game of learning music. The faster you recognize points on a staff, the more points you score.

Order No.: W16...\$16.95 + shipping

JANUARY 1989 DISK

■ **Transformer** stretches the capabilities of your Hi-Res screen! Twist, stretch, and shrink any portion of the screen.

■ **Picture This!** a command that loads Apple IIGS Super Hi-Res graphics onto the screen from

BASIC. We also include a demonstration slide show program.

■ **Noggin** will boggle your brain and expand your vocabulary. This game challenges you to make words from the letters it shows on the screen.

■ **Memory Peeker Desk Accessory** shows you what's going on inside your Apple IIGS, but you need a way to install it. Sandy Mossberg's utility is the perfect solution.

Order No.: **W15**...\$16.95 + shipping

DECEMBER 1988 DISK

■ **City Centurian** is a lightning-fast arcade game. You patrol the Earth's first moon colony in your shuttle fighter craft and protect its cities from alien spacecrafts.

■ **Sort It Out** allows you to sort your address lists and any other text-based lists. It works very quickly and permits several levels of sorting within the same list.

■ **GS/FX** provides you with three stunning new ways to look at graphics on the IIGS. You can present a black screen and watch your picture load in color by color. You can also fade your picture out to black or "fold down" the screen, color by color.

■ **Getting the Big Picture** compresses Hi-Res graphics to 25 to 50 percent of the space required by normal pictures. Whether you're designing graphics for an arcade game or for business presentation software, you will find this program invaluable.

Order No.: **W14**...\$16.95 + shipping

NOVEMBER 1988 DISK

■ **NibbleWriter** is an easy-to-use 40-column word processor that you can key in yourself. It is screen oriented and includes a full function word wrap, insert and delete functions, and many more useful features.

■ **SpeedDraw** is an Applesoft tool that lets you create smooth curves and sharp angles on your Hi-Res screen. It takes care of all the trigonometry for you and all you have to do is learn SpeedDraw's ampersand commands.

■ **Startup Name Changer** allows you to run any program from any directory when you boot up. Just make sure your program's name conforms to standard ProDOS rules and the pathname is 64 characters or less, and you will never again have to memorize what each startup program does or keep them in the top level of the directory.

■ **Object Module Format** helps you to customize the START program so you can boot up into any ProDOS 16 application.

Order No.: **W13**...\$16.95 + shipping

OCTOBER 1988 DISK

■ **ChartWorks** is an AppleWorks graphics utility that allows you to display and graph your spreadsheet files. You can read in files, display them, designate rows and columns of the spreadsheet as arrays, and graph that data in a number of different ways.

■ **Fiver Dicer** is a Yahtzee-like dice game that requires a combination of luck and skill. You can play it with a friend or you can compete against your computer.

■ **Attaching Ampersand Commands** provides you with a set of machine language utilities that you can attach to the end of your Applesoft programs. These utilities help fill some of Applesoft's gaps.

Order No.: **W12**...\$16.95 + shipping

SEPTEMBER 1988 DISK

■ **Bill Keeper** helps you organize and chart all your monthly expenses. With this menu-driven household bookkeeper you can track expenses for up to 40 different accounts and add up monthly and yearly totals.

■ **Sound Master** takes advantage of the sound capabilities of your Apple II. Use it to create dazzling sound effects and perfect harmonies, without any extra hardware.

■ **Applesoft Page Lister** provides you with an easy way to print professional-looking Applesoft listings. It makes sure that your listings don't run over the page perforations and it adds a title and page number to each page.

■ **File Typer** is a Classic Desk Accessory that will display or print any type of file. Because it's a desk accessory, it's always available when you need it.

Order No.: **W11**...\$16.95 + shipping

AUGUST 1988 DISK

■ **NibbleTerm** connects you to the Apple II online community. This telecommunications program works with your modem to hook you up to other Apples and network services too.

■ **Zapz** challenges you to outwit your opponent. You and your opponent each control the direction in which the other shoots the deadly Zapz.

■ **Disk Drive Tester** will help you keep your 5.25-inch disk drives in top shape. The program shows you the drive speed — just follow the article's step-by-step instructions to adjust it.

■ **Classic Desk Accessories** explores the structure and operation of these utilities. Sandy Mossberg also provides GSInfo, a CDA that keeps you posted on your system's inner workings.

Order No.: **W10**...\$16.95 + shipping

JULY 1988 DISK

■ **NewsMaker** takes text files from AppleWorks or any other word processor and prints them out in two columns. Reduce pasteup chores when using The Newsroom or Print Shop by preformatting your work.

■ **Pyramid** presents a challenging solitaire card game on the Hi-Res screen. Can you disassemble the pyramid and win? Use the card-drawing routines in your own programs.

■ **Applesoft MatchMaker** helps you track different versions of programs you're writing, and points out the differences to make sure you're up to date.

■ **The Newsroom Converter** combines The Newsroom's layout abilities with AppleWorks' word processing power. Move text into and out of The Newsroom and merge Newsroom files.

Order No.: **W09**...\$16.95 + shipping

JUNE 1988 DISK

■ **QuickWriter** emulates an electronic typewriter, for those small typing jobs that should be finished before your word processor finishes loading. This full-featured program allows you to save your work, too.

■ **Screen Print Command** installs directly into ProDOS, giving you a handy way to print the contents of your text screen.

■ **Super Hi-Res Graphics Converter** brings all of your Hi-Res artwork to the Apple IIGS graphics screen, with many options for the type of display.

■ **MouseTrap** takes your Hi-Res graphic and stores it in Print Shop format. Use the mouse or keyboard to capture any part of the Hi-Res screen.

Order No.: **W08**...\$16.95 + shipping

MAY 1988 DISK

■ **Poster Creator** allows you to turn your Hi-Res and Double Hi-Res art into huge posters. With it you can blow up your charts and graphics so they can be seen from across the room. A typical poster can consist of up to 12 sheets of 8.5- x 11-inch paper for a normal Hi-Res picture or 24 sheets for a Double Hi-Res creation.

■ **Command Set** helps reduce the tedium of performing some common Apple II tasks by adding eight commands to your BASIC Interpreter.

■ **ProDOS Repro Command** is a powerful addition to ProDOS that copies entire directories with a single command. Move a directory of files from one volume to another quickly and easily, or load or clear your RAM disk by issuing a single command. You can speed up file transfer and hard disk backup, easily change the directory of your RAM disk, and selectively transfer only the latest version of your files.

■ **AppleLiner** turns Apple Writer II into a powerful outline processor with full editing capabilities. Organize your ideas into outline form without giving up basic text editing and document formatting capabilities.

Order No.: **W07**...\$16.95 + shipping

APRIL 1988 DISK

■ **PrintWorks** lets you use proportional printing in multiple fonts on your Hi-Res screen. Dress up your Applesoft programs with fancy output. A font editor is included so you can create your own proportional fonts.

■ **Connection** is a game that challenges you to compete against your Apple for territory on the Hi-Res screen. Think it's easy to win at first? This is a smart program — the more you play, the better the Apple gets!

Learn Applesoft at your own keyboard!

Hands On Applesoft shows you how. You'll learn the art of creating Applesoft programs, from start to finish. Many beginner's books teach the commands, but don't tell you how to put them together. *Hands On Applesoft* is different. It gives you over 30 examples that show exactly how to write, modify and debug your own programs.

Disk operations are an integral but often-misunderstood part of most Applesoft programs. *Hands On Applesoft* includes detailed, easy-to-understand instructions for mastering disk storage techniques.

Bugs! Despite your best efforts, you'll undoubtedly run into program errors. The chapters on debugging show you how to untangle the snarls, exterminate the bugs and turn your programs into polished gems.

Programmer's Disk

All of the example programs, plus two high-powered programming utilities, are available on optional diskette. **Turbo Editor** makes writing and editing programs as simple as using a word processor. Use it to scroll through your program forward or backward, insert characters and perform searches. **Applesoft Tutor** is a debugging aid that gives you detailed error messages and suggests remedies.

Whether your goal is to tinker, to gain more control over your Apple, or to become a professional programmer, here's the place to start. Order your copy today!

■ **Fractal Trees** shows you how fractals, the exciting combination of mathematics and graphics, create the shape of nature. You can set up normal-looking fractal trees, or go for the alien and the bizarre!

Order No.: **W06**...\$16.95 + shipping

MARCH 1988 DISK

■ **Energy Squeezer** can help you take the heat off your utility bill. Discover how your home uses energy and learn where you can save. Spreadsheet-style data entry makes this program a snap to use.

■ **Be An Assembly Language Disk Jockey!** Learn the ins and outs of reading and writing disks with S. Scott Zimmerman's comprehensive tutorial programs. Both ProDOS and DOS 3.3 routines are examined.

■ **Binary II Forever**, say many Apple II telecommunicators. Binary II allows you to compress and unpack software you've downloaded from on-line services. You can also pack related files together.

■ **Speed Set GS** quickly and easily changes the speed of your Apple IIGS. Put away the Control Panel because this common activity can now be done under control of your own software.

Order No.: **W05**...\$16.95 + shipping

FEBRUARY 1988 DISK

■ **File Revival** is Sandy Mossberg's full-featured utility to recover files you've accidentally deleted. ProDOS 8 versions 1.3 and later preserve the directory information this powerful program need to reincarnate files inadvertently wiped off your disk, even if they were buried in a subdirectory.

■ **Supergraphics GS** gives you the power to create stunning Super Hi-Res displays from BASIC. The 15 ampersand commands control the graphics screen from within your own Applesoft programs. Complete palette control lets you achieve dazzling effects.

■ **AMPOS** gives you a quick and easy way to position the cursor and print on both the 40-column and 80-column screens. This three-parameter ampersand command also fixes a bug in some IIe 80-column cards. Stop worrying about cursor control — let one simple statement handle it all for you.

Order No.: **W04**...\$16.95 + shipping

JANUARY 1988 DISK

■ **Message Center** turns your Apple II into a household bulletin board. Improve communications in your busy home or office, and keep everyone up-to-date on important events. Display messages at certain times, or leave private messages to special people.

■ **Floppy Copy** is a zippy disk copying program. This program uses your Apple's extra memory to reduce the number of disk swaps. Copy DOS 3.3, ProDOS, and Apple Pascal disks quickly and easily.

■ **Chinese Checkers** brings an adaptation of the classic strategy game to your Apple. Play against a tough computer opponent on a colorful Hi-Res game board. Can you outwit your Apple and get your marbles across the board first?

■ **Hi-Res Circle Generator** demonstrates how to draw circles quickly and easily. Just poke in the center coordinates and radius and CALL the machine language routines.

■ **Super Hi-Res Picture Packer** compresses and displays your collection of Apple IIGS Super Hi-Res Graphics. Store an art gallery on disk with the space this handy utility will save. You can also pack and unpack selected rectangular portions of the screen, to animate your own graphics!

Order No.: **W03**...\$16.95 + shipping

SOFTWARE DIRECTORY

3-for-2 Sale!

Browse through our Software Catalog and see how easy, fun and inexpensive buying software can be!

Whether you want to organize your home finances, draw splashy graphics, play games, or improve your programming efficiency, you'll find a Nibble Software disk that meets your needs.

We offer practical software that works quickly and easily. And we offer it at a low price! Chances are, you won't find this value elsewhere.

Nibble diskettes are not copy-protected. They come with copies of the original articles that show not only how to use them, but also how they work. It's a great way to learn programming techniques for customizing or writing your own programs.

And because we understand that Apple users don't upgrade every year, all Nibble programs run on the II Plus, IIe, IIC, and IIGS unless otherwise noted. Most programs are in DOS 3.3 format and can easily be converted to ProDOS using the enclosed instructions.

3-for-2 Sale!

10th Anniversary Offer

It's EASY!

- 1. Pick your three favorite Nibble disks.**
- 2. Send your payment for the two higher priced disks.**
- 3. Your third choice is FREE!**

Hurry! This offer expires 3/31/90!

(The free disk is the lowest priced of your three selections.)

**Now, turn the page
for some easy shopping...**

Here are two easy ways to order Nibble Software:

- 1. Call toll-free 1-800-888-1660 for fastest service. Have your MasterCard or VISA handy, along with the software order numbers and the names of the software you want. Ordering hours: 9:00 am-5:00 pm Eastern Time.**
- 2. Or tear out and mail the Products Order Card you'll find in this issue to order software, disk subscriptions, books and magazine subscriptions.**

OUR GUARANTEE

Nibble software is guaranteed to perform as advertised. If you are dissatisfied for any reason, simply return the disk, documentation and invoice to us within 45 days of purchase. We'll refund the full purchase price.

APPLESOFT

POPPING

*It's as
popular as
the WAIT
command,
and about
as well
understood —
that is, not
very well.*

Meet POP.

No, I'm not talking about dear old Dad. And I'm not talking sodas or modern culture.

This POP is an Applesoft command. It's as popular (no pun intended) as the WAIT command, and about as well understood — which is to say, not very well.

But POP can be useful when applied properly. Therein lies the problem — applying it properly. To do this, you need to understand the fundamentals.

USING THE PROGRAMS

Study the four listings and run the programs as you read the tutorial section of this article. You should find the programs self-explanatory; any special instructions will be covered by the tutorial.

ENTERING THE PROGRAMS

Type in Listing 1 and save it with the command

SAVE POP1

Repeat this step with the three remaining listings, substituting the appropriate filename when you issue the SAVE command.

For help with entering *Nibble* listings, see the Typing Tips section.

HOW THE PROGRAMS WORK

Executing a POP “causes one RETURN to “pop” off the top of the stack of RETURN addresses,” says the Applesoft Programming Reference Manual. “The next RETURN encountered after a POP causes a branch to one statement beyond the second most recently executed GOSUB.” So there you have it, right? It's great if you know what the stack is. Those of you who do, skip the next few paragraphs. The rest of you stay put.

Mark Craven, 662 Raygene Way, North Salt Lake, Utah 84054. This program is compatible with DOS 3.3 and ProDOS.

Page 1 of RAM (\$0100-\$01FF hex, 256-511 decimal) is reserved for use by this mysterious stack. Here, addresses are stacked, or piled up, on a last-in-first-out basis. Applesoft needs to know where to go when RETURNing from a GOSUB. (See Figure 1.)

ADDR #1 was the first address put on the stack, and ADDR #N was the most recent. The addresses are retrieved in reverse order — that is, ADDR #N would be the first off and ADDR #1 would be the last off. Naturally, there is a finite number of addresses that can be stored within this limited space of 256 bytes; Applesoft allows only 25 active GOSUBs before the ?OUT OF MEMORY ERROR is displayed. This is demonstrated in the first program, POP1 (Listing 1).

Note that we execute GOSUBs with abandon but never a RETURN. A RETURN would remove the addresses from the stack. So, when the maximum number of addresses are on the stack, we get the message, ?OUT OF MEMORY ERROR.

To fix this problem, use the next program, POP2 (Listing 2). This program goes overboard in the other direction. Note that in line 90 we execute the GOSUB and in line 100, rather than just RETURN to end the program, we POP the address off the stack and GOTO line 90 again. Running this program will show that overzealous use of POP can cause your program to run for a very long time! In this program, the stack never gets to grow at all, since every executed GOSUB is followed by a POP, stripping off the RETURN address. Not very effective programming.

Overzealous use of POP can make your program run a very long time.

POP3 (Listing 3) is another simple program with lots of GOSUBs with which to play. Running this program without any changes will just print the five messages indicated in lines 150-230. Note that there are five GOSUBs and five RETURNS. Now, be bold. Change line 240 to POP:RETURN instead of RETURN. Run the program and see what happens.

Got the error message, didn't you? But this time, the error message was ?RETURN WITHOUT GOSUB ERROR.

By executing the POP, you removed an address from the stack. When the program looked for the last address on the stack and found none, the error message was displayed and the program was halted.

This error is really the only error you will ever see displayed because of the POP command. All other errors manifest themselves in less obvious, more devious ways.

When you use the POP command within nested GOSUBs, make sure the subsequent program logic returns the flow within the previously executed GOSUB. If this is not the case, you will RETURN from a GOSUB to a part of your program from which you did not start the next time a RETURN is encountered.

If you want to exit several GOSUBs, you should issue a POP for each GOSUB, then continue normal program flow, free of any

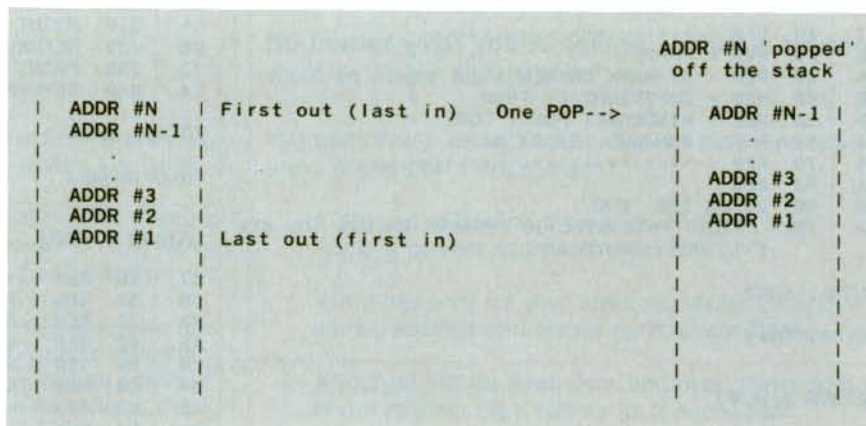

Figure 1: The "stack"

pending GOSUBs. This is demonstrated in the last demo program, POP4 (Listing 4).

In this program, you have two choices. You can press Return to execute a normal RETURN statement in line 150, whereupon a message will be printed indicating normal program flow is continuing. Or, you can press Escape and branch from the GOSUB with a GOTO 170 in line 140. This will clear the address on the stack generated from the GOSUB in line 90 and direct program flow to line 170, which will print a message indicating you just executed a POP. Run the program several times using the two options. Then list it and follow the logic of your choices.

Remember, when you issue a POP, there is no associated branch as in a RETURN. If you want the program flow to go someplace special, you must supply that branch. See the GOTO in POP4, line 140.

One of the most practical uses I have found for the POP command is in subroutines where one option to the user is RETURN TO MAIN MENU — or a similar statement in which the user can choose to exit the routine entirely and move to another part of the program.

An example of this is in NIBBLE MEDIC (Nibble Vol. 6/No. 3; errata in Vol. 6/No. 6), a program in which I used subroutines extensively for input error checking.

The program was within only one GOSUB routine when checking errors; a simple POP:GOTO line number was executed whenever an input error was found. This saved some coding space by not having to check for an error flag on the RETURN each time a check was made.

Study the uses of POP within program listings, read all you can about it in your programming manuals. Use it with care, and in situations where there is a real need — it's easy to get carried away. And that's when you get into trouble.

Still, that shouldn't stop you from adding another Applesoft command to your repertoire. Get POPping!

Two Minute Apple Programs!

They're unique! They're quick. They're easy.
And they'll give you hours of enjoyment.

Got a Minute?

It only takes a minute or two... and you'll have your Apple II doing incredible things. Play a quick game of *Mini Break Out*. Or *Melt Down* your text screen. Entertain yourself with the wriggling graphic antics of *Worm*. Or spin your cursor like a cheerleader with *Twirler*.

Nearly 200 Selections

And that's just the beginning. With nearly 200 of *Nibble's* best One- and Two-Liner programs to choose from, you can't go wrong. Use *SuperFinder* to locate any hex string in memory. You won't believe how easy it is to sort things out until you try the two-line *Alpha Sort* program. And many of these quickies are powerful add-ons to your own program projects.

Utilities Galore

Try *Low-High Convert* to create hi-resolution versions of your Lo-Res graphic screens for printing. Or use *Free Space* to find out how much room is left on your ProDOS volume. *Amper Input* accepts those nasty commas and colons without missing a beat. Or become a Lo-Res artist with *Mini-Draw*, and paint in 16 colors to your heart's content.

ALL NEW

In addition to the best of *Nibble*, this one-of-a-kind volume contains dozens of brand new programs — never before published. With games, utilities, graphics, music, and arcade action, there's something for everybody! You'll be amazed at the power that's packed into each of these snappy winners.

You Get A Disk TOO!

If you'd rather be using than typing these little gems, you can slip the disk collection — nearly 200 in all — into your Apple II system and begin running them right away. Then when you see a program you really like, you can examine the programming techniques and learn to use them yourself!

MISCOMMUNICATION

► Loren Wright's otherwise excellent review of four modem packages ("Let Your Fingers Do the Talking," *Nibble*, Vol. 10/No. 10) contained some small errors.

I was the GENie sysop that Wright contacted about the Ymodem and Xmodem 1K bug with GENie. There appears to have been a miscommunication between us. Xmodem CRC transfers are definitely not as fast as Xmodem 1K transfers.

However, I have found that if ProTerm is told to receive files with Xmodem CRC, and GENie is instructed to send with Xmodem 1K, these 1K transfers usually go through without difficulty.

Also, I should mention that since the article was written, GENie has begun to support Zmodem. Yet, again, ProTerm doesn't work reliably with GENie's implementation. We have been told by Checkmate Technologies that Greg Schaefer, ProTerm's programmer, is working on a fix, but as of today (Oct. 12, 1989) no fix has been made.

ProTerm is an excellent modem program, along with several others not reviewed by Wright, including Don Elton's Talk Is Cheap, which has a fantastic macro programming language and other solid features, and Bob Garth's Apple Communications Terminal (ACT).

Thanks for your excellent publication.

*Don Esmay
GENie Apple II File Librarian
Blue Island, IL*

THE ERROR TRAP

■ **DB Construction Kit** (Vol. 10/No. 9, p. 28, Listing 1: DCK): Line 1200 is missing. Add the following line.

1200 REM

■ **Nibble Assembler** (Vol. 10/No. 11, p. 16): The program does not correctly assemble programs with BASIC.SYSTEM 1.0. The program requires BASIC.SYSTEM 1.1 or greater. If you are receiving a "No buffers available" error when running programs assembled by Nibble Assembler you should check the version of BASIC.SYSTEM.

Tech Support

If you need help with your *Nibble* program, contact the Nibble Technical Support Staff at *Nibble*, 52 Domino Drive, Concord, MA 01742. Please include a self-addressed, stamped envelope. Phone support is available on the Tech Support line from Monday through Friday between 2 and 5 PM EST at (508) 371-1669.

Nibble Hot Line

If you own a 300- or 1200-baud modem, call the Nibble Hot Line to receive the latest errata notices, download a One-Liner, or order a Nibble/MindCraft product. The Hot Line provides up-to-the-minute, 24-hour technical information on *Nibble* programs plus other Apple goodies. Have your Apple call our Apple at (508) 369-8920. Set your communications software at 8 data bits, 1 stop bit, no parity, full duplex. The Hot Line will automatically determine the correct baud rate.

Do you have an Apple product to sell?

No matter what you're selling... *Nibble* readers want to know about it!

You won't find a better deal for Apple // classified advertising *anywhere!* Here's why:

- Your ad will reach more than 100,000* avid Apple // buyers each and every month!
- You pay only for your sales message. Company name, address and phone number are **free!**
- Your ad will be **seen** over and over again! 95% of our readers save *Nibble* as a permanent reference!

The deadline for ad placement is the 1st of the month 2 months prior to the cover date (e.g. October 1st for the December issue). For additional information see the marketplace section in this issue, or address further questions to:

CHOOSE WITH BOOLEANS

It's
either
on or off

A Boolean, you say? Well, not lately. I'm on a diet. Oh, you mean a Boolean. Of course! Right. What's a Boolean?

If those words could be yours, fear not — this article will not cover some exotic little trick of machine language.

If, instead, you are thinking, *Another article about Boolean logic — so who cares?* then hold on a minute. Even you old-time hackers can learn some Boolean tricks — in Applesoft.

Boolean logic can be used in Applesoft programs to save time and space, thereby solving problems more efficiently.

To understand Boolean logic is to understand the difference between yes and no. Now, is that difficult? You now understand everything about Boolean logic. Sort of.

If it were really that simple, you would have understood and used it long ago, right? Well, let's muddy the waters and explain it a bit more.

A Boolean expression is one that can be evaluated to True/False, on/off, yes/no, 1/0. The Applesoft Basic Programming Reference Manual includes a table of Boolean operators. Unfortunately, the manual says almost nothing about how to

use these Boolean operators and, worse yet, they look just like normal arithmetic operators.

USING THE OPERATORS

Consider the problem of toggling upper- and lowercase. This is an important concern when you're writing a program on the IIe or IIc for possible use on the II Plus, which is without lowercase. One solution is to have your program BLOAD a machine-language program, through which all output to the screen will be routed. That way, you can have lowercase text in your program or text files, but if the program is being run on an Apple II Plus, the screen will display the text in uppercase.

Suppose that your machine-language program is loaded in memory at address \$9400 (37888 decimal). And suppose it takes the value of the second byte (37889) and adds it to the ASCII value of the given character to produce lowercase. In other words, to activate lowercase, you POKE 32 into memory location 37889; to turn it off, you POKE 0 into location 37889.

Normally, you would use a separate IF statement every time you wanted to change the case status. But IF statements are messy. For one thing, they often demand the use of a GOTO after the condition has been satisfied, and that's a transgression in structured programming.

Suppose we set up a single subroutine to accomplish both tasks — turning lowercase on and off. All you need to do is set a flag, F, before calling the subroutine. If you want lowercase on, set F = 1. To turn lowercase off, set F = 0. Then: GOSUB 10.

As you may know, computers operate on electronic impulses. And an electronic component is either on or off. That's why the lowest level of machine-language the computer can understand consists of instructions rendered in binary numbers. Of course, in the binary numbering system, you can only have the value 0 or 1. To the computer, those numbers represent on and off.

```
10 POKE 37889, 0 + (32 * (F > 0)) : RETURN
```

That's all there is to it. The last part — (F > 0) — is the Boolean expression. If F is set to 1, the expression evaluates as TRUE and returns the value 1. If F = 0, the expression evaluates as FALSE and returns a value of 0. If you substitute either of these values for the Boolean expression, you get 0 + (32 * 1) = 32 for lowercase,

Kenn Chapman, Qayar Systems, M.P.O. Box 622, Hamilton, Ontario, L8N 3S7.

and $0 + (32 * 0) = 0$ for uppercase.

This solution surfaced while I was working on a bulletin board program that would be called by a variety of computers. Some would accept lower case; others would not.

In the same program, I needed to control the line feeds after a return. Again, because of the variety of computers calling the BBS, it was necessary to issue ($F = 1$), or suppress ($F = 0$) the line feeds. The following expression accomplished both functions depending on the value of F :

```
20 POKE 1914, 6 + (16 * (F > 0))
```

The value 6 or the value 22 is POKEd into memory location 1914, which tells the modem if it should send a line feed character after the RETURN character.

Computers operate
on electronic
impulses; components
are either on or off.

A much more practical example is the common Yes/No response. Suppose you have a menu routine that offers the choice of just having the letters displayed or the full word/command displayed. Does this mean you have to write two complete routines? Not at all.

```
10 HOME: PRINT "<C>";: ON (A$ = "Y") GOSUB 20:  
RETURN  
20 PRINT "HOICE";: RETURN
```

If you want abbreviated commands, line 10 will print $<C>$; if you want full commands, lines 10-20 generate $<C>$ HOICE. The advantage of this structure is that it lets you pack more instructions into a single line of code, thereby reducing the number of line numbers, not to mention the elimination of one more IF instruction. Also, this example assumes that when program control RETURNS from a GOSUB, the next executable instruction is performed.

How often have you seen or written a program that asks if you want a report sent to the printer or the screen? If the answer is "printer," two instructions are required, often as subroutines, and an IF test. How about a single subroutine?

```
10 PRINT D$ "PR#" (F = 1): RETURN
```

or

```
10 PRINT D$ "PR#" (PR$ = "Y"): RETURN
```

The latter is preferred; it doesn't require $F=1$ to be set every time a report is processed. A PR#0 statement can be issued at the end of the report and even if the printer is already off, it won't do any harm.

To conclude: Boolean expressions can be used whenever a Yes/No or toggle situation exists. And it will improve your program's execution by eliminating otherwise "bloated" commands. 

nce Upon A Time Only Advanced Programmers Could Achieve Machine Language Speed.

But today *anyone* with just a basic knowledge of programming can write programs that run at machine language speed. It's easy with MACROSOFT, a new language that works with The Assembler.

Using MACROSOFT, you write Applesoft-like programs which are converted into machine language by The Assembler. Like magic. You get the benefits of speed and efficiency without the hassle and hard work of learning machine language!

Imagine, running your programs up to 10 times faster than compiled Applesoft. That's up to 50 times faster than regular Applesoft!

Create lightning-fast games and spectacular graphics. Ideal for number crunching! For the more advanced programmer there's the convenience of mixing assembly language and MACROSOFT in the same program.

Now you don't have to be a magician to move up to machine language — with MACROSOFT!

To order fill out the attached coupon or call 1-800-888-1660.

by Steve McLendon

If you've written many game programs, you've probably had need of a random-number generator, perhaps to simulate a six-sided die. If your program is written in BASIC, obtaining a random number is easy — type RND (1), followed by the appropriate multipliers. But if you've graduated to assembly language, the matter is not so simple. There is no opcode or mnemonic that generates a random number. You must build the subroutine yourself.

ASSEMBLY RANDOM

Assemble

complete

disorder

When your machine program needs a random number, it should be able to jump to a random-number subroutine and fetch one. The Monitor has a subroutine that generates a random number — KEYIN, at \$FD1B. It generates a random number from 0 to 65,535 in location \$4E (LSB) and \$4F (MSB). The only problem with KEYIN is that it requires a keyboard input to exit. In some cases this may be acceptable, but if you need the program to fetch a random number and continue, KEYIN is not the answer.

AN ASSEMBLY SOLUTION

Perhaps the most convenient means of accomplishing the task is to use the same subroutines BASIC uses. When you ask for RND (1) in BASIC, the muscle comes from the subroutine located at \$EFAE. It uses this subroutine to generate the random number each time you do a RND (1). On exit, the number is stored in memory locations \$C9-\$CD. Memory location \$C9 holds the exponent, while \$CA through \$CD contain the mantissa for Applesoft's floating-point scheme.

NUMBER GENERATOR

Generally, a random number between 0-255 is all that is required. It can be scaled to whatever you need. Suppose you want to generate a random number from 1 to 6. Appropriate scaling would take the form

$$\frac{N+6}{255}$$

in which N represents your 0-255 random number.

Steve McLendon, 2919 New Plymouth, Webster, TX 77598. This program is compatible with DOS 3.3 and ProDOS.

USING THE PROGRAM

Using RANDOM.TEST is simple. Just run it and keep pressing Return for a random number between 1 and 6. If you would like to incorporate this random number system into your own programs use the same format that appears in lines 110-120. First, BLOAD RANDOM.GEN. Then issue a CALL 24583. To extract the number, execute a PEEK(24580). Whatever variable you assign to the PEEK will hold the new random number.

ENTERING THE PROGRAM

If you have an assembler, type in the source code from Listing 1 (the MindCraft Assembler was used here). Assemble it, then save the object code as RANDOM.GEN. If you don't have an assembler, enter the Monitor with

```
CALL -151
```

Enter the hex codes from Listing 2 and then type

```
BSAVE RANDOM.GEN, A$6000, L$71
```

You might also want to enter the demo program from Listing 3, RANDOM.TEST. Once it is entered, save it with

```
SAVE RANDOM.TEST
```

For help entering Nibble listings, see the Typing Tips section.

HOW THE PROGRAM WORKS

Listing 1 is an assembly subroutine to generate a random number between 1 and 6. After setting the initial conditions, the program jumps to the subroutine at \$EFAE. It then picks the number from 0 to 255 generated by \$EFAE and placed in memory location SCC. Remember that \$C9 through \$CD hold the complete, floating-point random number. Actually, any of the \$CA-CD addresses will return a number from 0 to 255, but I found that memory location \$CD favors numbers in the middle of the range (100-150). Location \$CC gives a more even (random) distribution.

After the appropriate multiplication and division, the random number is stored in QUO. When N*6 is divided by 255, there is usually a remainder (REM). If the remainder is ignored, QUO returns a 6 only 5 to 6 percent of the time — instead of the 16-17 percent a six-sided die yields. To get the number 6, \$CC would have to return a perfect 255. To remedy this, the program checks to see if there is a remainder. If so, QUO is incremented by 1.

Finally, QUO is checked for zero (there is no zero on a die). If QUO=0, then QUO=1.

To check the randomness, I wrote a BASIC program to call this subroutine 1,000 times, counting the number of times each number was generated. The distribution was very even — a 6 was generated just as many times as any other number from 1 to 5.

MODIFICATIONS

If you need a random number other than 1 to 6 — say 1 to 20 — load MUL2 with the number 20 (\$14) in line 11; or, in the actual machine code, change memory location \$6008 to \$14 (or whatever number you require). If you're using AppleSoft, then POKE 24584,X (in which X is the highest random number required) immediately before CALLing this routine.

*Education
can be
child's
play*

STORYBOOK LEARNING

Teachers and parents have known for years that children learn better when learning is fun. The three programs reviewed here make it just that. They approach children's literature and reading skills in entertaining ways, appropriate for the user's age. Yet each one offers something unique and creative. **The Ugly Duckling**, from Byte Works, is a talking, animated storybook for the IIGS, designed to help your child learn to read; **Stone Soup**, from William K. Bradford, works on reading and writing skills and runs on the Apple IIc, IIe, and IIGS; Compu-Teach's **Once Upon a Time... II**, for all Apple IIs, lets your child create high-quality, illustrated storybooks.

THE UGLY DUCKLING

The Ugly Duckling, based on the story by Hans Christian Anderson, opens with a "choice page" containing seven buttons — four for children and three for adults. The child buttons let children choose one of four ways to experience the story. The storyteller — a digitized, female voice — reads the choices to the child, who selects one by pressing a key as the choice is read. The mouse-activated parent buttons let you print the story (see **Figure 1**), choose between color and black-and-white printing, and quit the program.

The story begins after another voice prompt and keypress. As the storyteller narrates, the text appears below animated illustrations. Each word is highlighted as it is read to help the child follow along. You can select Stop and Go buttons at any time. You

Lisa Maddox, 1 Maureen Road, Lexington, MA 02173. Mrs. Maddox is pursuing a degree in Child Study at Tufts University and is a teacher's aide in Lincoln, MA.

can also use the Go button to have the page reread. Two arrow buttons will move you to the previous or the next page of text.

At two points in the story, your child can choose variations in the plot. The story breaks and a new choice page appears with buttons for two options — for example, having the duckling stay or leave. As before, the storyteller reads the choices, and prompts for a keypress.

On the initial choice page, child buttons activate the Read & Wait and Wait & Read modes. These options slow things down so the child can think as the storyteller reads. The Read & Wait approach highlights a word, reads it, then waits for the child to press a key or the Go button. The Wait & Read mode highlights each word but does not read it until the child presses a key or the Go button. This lets the child read each word, then check for the correct pronunciation.

In these modes, shorter words tend to sound muffled, but they are not unintelligible.

Finally, a No Sound button takes the child through the story with nothing read aloud.

**The more interest
you show in the
program, the more
interest your children
will show.**

You can print the story of The Ugly Duckling in full color, using a color ribbon and an ImageWriter II, or you can print the story in black-and-white to create a coloring book.

The Ugly Duckling is successful at meeting its goals. It was designed for pre-readers and beginning readers, and it's easy enough for young children to use with little adult supervision. Children must know how to put in the disks correctly and, if you only have one disk drive, how to change them. The Ugly Duckling helps children with this process by ejecting disks automatically. In addition, on-screen graphics demonstrate the correct way to insert a disk in the drive; the graphics and disks are color-coded for easier recognition. Of course, if you don't have a color monitor, this won't help. The program just ejects an incorrect disk and waits for the right one.

Another aspect that makes this program easy to use is that, in most cases, the storyteller reads directions to children, and allows them to choose without reading all the words. Also, children never have to press a specific key, because any key will do — that is, any key but the Open Apple, Control, or Shift keys. Using the mouse is simple also; you just click on an icon, such as an arrow, and the mouse cursor is restricted to the bottom area of the screen.

An "auto mode" reads the story automatically if no buttons or keys are pressed after the program begins.

The illustrations are well done; the animation is simple, but adds interest.

The Ugly Duckling handles errors well. Unfortunately, at least two bugs exist in the program. On two pages, the word highlighting lags behind the reading. I also could not use the Go button to repeat the text in these cases; it just ignored the command. (These problems have reportedly been fixed in a later version.)

Three cute little baby ducks broke open the first three eggs. "Cheep, cheep, cheep," said the baby ducks. "Quack, quack," said the mother duck.

Figure 1: Ugly Duckling printout

Documentation

The documentation is just eight pages long, but is well done, and explains how to use the program completely. It also instructs adults in helping children learn with the software, and in using the program with children in a personal way. For instance, it says, "We like to use this mode (no sound) as a bedtime story, with our daughters occupying a knee while we read the story to them."

The documentation also notes, correctly, that the more interest you show in the program, the more interest your children will show.

Summary

On the whole I was pleased with The Ugly Duckling. The story is a classic, and should have wide appeal to children. The animation adds an aspect to the story that a picture book could not. And the four approaches to the storytelling will aid children as they begin to learn words. The ability to print the storybook also is a big plus; children can color, and learn the story without having to be near a computer.

STONE SOUP

Also based on a children's classic, Stone Soup is a three-part program, comprised of Story Teller, Story Maker, and Activities sections. The sections are chosen from a "contents page," which instructs you to select the proper disk from the two double-sided disks included in the package. It is also available on a 3.5-inch disk.

"Once upon a time, there was a beggar," the Story Teller begins. And an animated beggar walks across the screen. If you click on him with the mouse, you can move him to a different spot and he'll start walking from his new location. You can even make him walk in the air!

A scroll icon at the top of each page calls up a window of text when pressed with the cursor; some pages have numbered speech balloons, which operate in the same manner. Right- and Left-Arrow keys control movement between pages (see Figure 2).

Stone Soup is great fun. You can move most characters and objects in the scenes, so you are motivated to explore. If you want to produce more copies of a particular object, just select it and press the Space bar.

The software comes with a story guide, containing hints about hidden things in each scene. For example, in one scene, you can take the door off a farm house, move a woman, and find the food she is hiding. In another scene, the beggar will sit down to rest when you move him to the chair.

The Story Maker portion of Stone Soup can be used to retell the story or create a new story with the same objects, characters, and scenery. Graphic menu items provide the ingredients for your story. Select "Character" and you can add any of the animals or characters from Stone Soup; "Objects" provides inanimate objects from the story; "Background" presents a choice of two backdrops; and the

Figure 2: Stone Soup screen

ABC option lets you add short words and phrases. You can also create your own text by placing the cursor and typing.

The fourth menu item is a disk, which lets you save scenes or open existing ones.

The last item on the menu is a scroll icon, for printing pages. You can print your scenes in color on an ImageWriter II, or in black and white on other printers.

You can do a lot of nifty things in Story Maker. For example, you can take a log from the Objects menu and add it to the fire under the soup pot. You can create your own story, and you can label things in the scene as well. You also get a blank page to create an entire scene with text.

The Activities segment of Stone Soup offers six activities. Story Ideas contains seven scenarios from which children can develop their own stories. These are story-starters, some with humorous prompts. The second, for instance, reads, "What's this dinosaur doing in my soup?" In the picture, two girls sit at a table before a bowl of soup. A dinosaur's head and neck rise from the soup. You can select the dinosaur's head and pull the entire body out of the bowl. It's a neat idea, and is sure to delight any child (or adult).

As with Story Maker, you have the menu at your service so you can change or add text, objects, and characters.

A Puppet page contains main characters from Stone Soup, rendered so that you can print the page and make them into finger puppets or glue them to popsicle sticks.

A Treasure Hunt encourages children to explore each scene. And another activity, Recipes, centers around stone soup itself.

Stone Soup could stand some improvements. I found myself wishing that Story Maker and Story Ideas included, like Story Teller, an option to return to the previous page.

If you forget to save your scene before advancing to the next page, it's gone. A popup reminder about saving would be helpful. Also, if you create a story, you must save each page one by one. There is no way to save the whole thing at once.

Documentation

The documentation for Stone Soup is excellent. A 16-page user's manual complements the Story Guide, including complete directions for all of the features and a section on troubleshooting. There are "quick start" directions, and advice on how to work with children on the program.

Summary

The program is easy to use, although young children will need quite a bit of help to operate it. The story is a classic with a lot of appeal, and the options and hidden activities are great fun. And on the creative side, Story Ideas and Story Maker offer substantial inspiration. In addition to Stone Soup, Bradford's Explore-a-Classic series includes The Three Little Pigs and The Princess and the Pea.

ONCE UPON A TIME... II

Once Upon a Time... II, like its namesake, allows children to create their own stories, illustrate them, and print them in story-book form (see Figure 3).

The program opens with burst of multivoice music, courtesy of Bach, and a simple background. At hand are a set of option buttons and four pull-down menus.

Once Upon a Time... II provides objects from the forest, the ocean, and from the age of dinosaurs.

You can place objects by pressing the Draw Object button. A window will appear with a list of words representing objects you would find, for instance, underwater. These include barracudas, treasure chests, and puffer fish. When you click on a word from the list, a digitized voice reads the word. This will help beginning readers to choose their objects. To get an object onto your page you must type it in a text box below the list of words. After you have finished typing, click the OK button. The object will appear on your page, and the voice will identify it.

To choose the setting from which you select objects, click on one of the three buttons at the bottom of the Draw Object window. You can use objects from any of the settings on the same page of your story. For example, you might want to put a whale with a moose walking on its back, next to a scenic volcano.

Once you have an object on the screen, you can enlarge or shrink it to one of four sizes. If you choose the Flip option, it will reverse the object horizontally. An Erase Object button will remove the object from your page.

Adding words to the picture is easy. Just select the Write/Edit button and a message window will request your text, limited to four lines. Type whatever you want and select the OK button, and your words will appear at the bottom of the correct page. If you type more than four lines, it will simply stop and show what fits on your page. Users have the option of producing pages with only text, as well.

To make a new page, select the Next Page button, and a window will appear. If you choose a graphic page, you have a choice of eight backgrounds. These include a simple day background, a prehistoric day and night, a day and night in the forest, and three underwater settings. You can use any of the backgrounds within your story, switching between ocean, forest, and prehistory as you wish.

Objects can be moved about the screen with the mouse. When you select an object, it will be outlined in blue if you have a color monitor.

To liven things up a bit, you can select an object, then choose one of many colors from the Color menu. But an object can only be one color; if you want the woman to have a magenta dress, you'll have to settle for a magenta face as well.

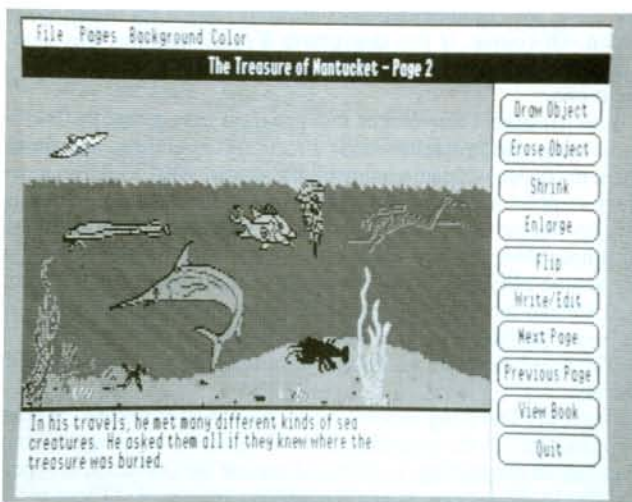

Figure 3: Once Upon a Time... II printout

You move through your story by pressing the View Book button. If the pace of the pages is too fast for your child, you can flip pages manually by clicking the Next Page and Previous Page buttons.

The Pages menu also contains options for inserting, deleting, swapping, and copying pages.

The version for the II Plus, IIe, and IIc is similar to the IIGS version but lacks the speech and the ability to change colors of objects.

Documentation

The 12-page manual that accompanies Once Upon a Time... II is more than adequate, and it's arranged well, so that you can find what you are looking for quickly. Adults can learn from it what to expect from children who use this program.

Summary

The makers of Once Upon a Time... II say children will have fun while learning "object categories, perspectives, word recognition, storytelling, and basic computer skills." It's a valid claim. The program's open-ended nature might also help children improve their writing and reading skills.

I was happy with Once Upon a Time... II. The screen arrangement makes the program easy to use. Also, the digitized voice in the IIGS version will help young readers make selections, even if they are unsure of the words they are seeing.

You can create some beautiful, and even funny, scenes with this program. The graphics are excellent. And the package even comes with colored pencils, with which children can enhance their storybooks.

SUMMARY

All three of these programs provide fun, enchanting ways for your children to develop skills at various stages of childhood.

For children who cannot yet read, or are just starting to read, The Ugly Duckling is an excellent choice. Its animated pages and digitized storyteller will pique your child's interest.

Beginning readers and writers will love the hidden surprises and the ability to rearrange the story in Stone Soup. Younger, non-reading children will need help with the text.

Once Upon a Time... II is the most open-ended of the three, and will help beginning to advanced writers develop skills in the composition and design of their own stories.

TYPING NIBBLE LISTINGS IN FOUR EASY STEPS

There are four main steps to typing in a program:

1. Create a work disk.
2. Type in and save the CHECKIT program.
3. Type in the listing with CHECKIT installed.
4. Save the program to disk.

STEP 1: CREATING A WORK DISK

Most *Nibble* programs work with either DOS 3.3 or ProDOS. If you have one particular program in mind, check the article for operating system compatibility.

If you are using ProDOS, copy the files PRODOS and BASIC.SYSTEM from a ProDOS master disk or from your System Utilities disk to a newly formatted disk. Apple IIGS owners should copy the file P8 from the subdirectory /SYSTEM.DISK/SYSTEM and rename it PRODOS in addition to copying BASIC.SYSTEM.

If you choose DOS 3.3 as your operating system, first boot your DOS 3.3 system master disk, then remove the disk from the drive and follow these steps:

1. Type NEW and press Return.
2. Type 10 HOME and press Return.
3. Insert a blank disk into the disk drive, type INIT HELLO and press Return.

STEP 2: TYPING IN CHECKIT

You're ready to type in the CHECKIT program shown on the following page. But before you type any program, clear the Apple's memory by typing NEW followed by Return. Remember, computers are very picky about how programs are typed. Be sure to type the program exactly as it is listed, including punctuation and spacing. After you've typed the program, save it on disk with the command

SAVE CHECKIT

STEP 3: USING CHECKIT TO ENTER A PROGRAM

CHECKIT watches your typing to see if you type a program line correctly. When you press Return at the end of a line, CHECKIT prints a number that will match the one published in the magazine if you've typed the line correctly. If the line is mistyped, the number printed won't match. CHECKIT runs only in the 40-column mode.

Once you've entered the CHECKIT program and saved it to disk, install it by typing

RUN CHECKIT

The first time you run CHECKIT, you

may get the message "ERROR IN DATA STATEMENTS." If this occurs, recheck the data statements at and before the line listed. Correct any errors and save CHECKIT to disk before running it again.

If there are no errors in CHECKIT you'll be given the option to choose whether you'll type an Applesoft or hexadecimal listing. Some articles have more than one listing and may contain both hex and Applesoft BASIC listings. You must RUN CHECKIT before typing in each separate listing. The article will describe the listings and identify them as either hex code or Applesoft BASIC code. The following two sections describe the process of entering an Applesoft BASIC listing and a hex listing.

Applesoft Programs

If the listing you wish to enter is identified as Applesoft BASIC, answer N to CHECKIT's question "Are you entering a hexadecimal file?" and the Applesoft BASIC version of CHECKIT will be installed. Once it is installed, you may begin typing in the Applesoft BASIC listing. Applesoft BASIC lines listed in *Nibble* begin with a CHECKIT code, followed by a line number and the Applesoft commands. Do not type in the CHECKIT code! Type in the line number and all of the characters up to the next line number before pressing Return.

Be careful to maintain spacing between quotes. Also, avoid resetting the Apple II when CHECKIT is installed. You can omit the comments after REM statements, although they usually contain useful information when you're reading the listing.

Let's enter a sample Applesoft BASIC listing. Boot your work disk and run the CHECKIT program. Since you're not entering a hex program, answer N to the question asked and CHECKIT will be installed in your Apple. Now you're presented with an Applesoft BASIC prompt character and a flashing cursor. You're ready to begin typing the listing. To enter the program shown in Example 1, type

```
10 REM RING THE BELL
```

followed by a Return. The CHECKIT code for that line (37) will be printed if you've typed the line correctly. If the code doesn't match, type the line again, paying careful attention to detail. Now type lines 20 and 30. After you've typed in the entire program, enter Control-Z (hold down the Control key and press Z) for the final check code. If the code you get doesn't match the printed code, you've probably skipped a line or have an extra line in your program.

EXAMPLE 1: BASIC.PROGRAM

```
37 10 REM RING THE BELL
54 20 FOR J = 1 TO 5: PRINT
    CHR$(7): NEXT J
91 30 END

TOTAL: 1CB9
```

Hex Programs

If the listing you wish to enter is identified as hex code, answer Y to the question asked by CHECKIT and the program will ask two other questions. It asks, "What is the starting address of the file?" and "What is the length of the file?" These numbers will be included at the top of the hex listings. Be sure the Caps Lock key is down when answering these questions and when entering the program. You'll have to enter the System Monitor with the command CALL -151. (The System Monitor is simply the part of your computer used for entering machine language.)

Machine language programs are published in a "hex dump" format. This means that an address is displayed followed by bytes stored in those addresses. The numbers may look unfamiliar because they are in hexadecimal (base 16) notation. For instance, in Example 2, the number stored in address 0300 is A2. In address 0301, the value 05 is stored.

To type in Example 2, you should boot your work disk and run CHECKIT. Answer Y to the first question asked. As you can see from the beginning of Example 2, the starting address is 0300 and the length is C. These numbers should be entered at the next input prompts. CHECKIT will be installed and you should see a System Monitor prompt. Now enter

```
0300:A2 05 20 DD FB CA F0 03
```

followed by a Return. The number 73 should be printed below your line. If it's not, retype the line. Now enter the second line in a similar fashion and press Control-Z for the final check code. Again, if this final number doesn't match, you've probably skipped a line in your typing.

EXAMPLE 2: HEX.PROGRAM

```
START: 300                      LENGTH: C
73 0300:A2 05 20 DD FB CA F0 03
80 0308:4C 02 03 60

TOTAL: E52E
```

EXPIRES 2/28/90

"We Love Our Customers"

To check your typing by listing the program, first type the address you want to check and press Return. This will display the address and the byte entered at the address. To display a range of addresses, type the first address you'd like to see, followed by a period and the last address. For example, to see addresses 0300 to 03A0, type

0300.03A0

followed by a Return.

Special Note for IIGS owners: When displaying an area of memory, an additional number followed by a slash (/) will appear before the address in your display. To the right of the eight bytes listed in the line,

there will be eight additional characters displayed. These have no relationship to the numbers produced by CHECKIT and may be ignored.

STEP 4: SAVING THE PROGRAM ON DISK

You should save the program to your work disk periodically while entering the listing and after completing a program. Saving a program on disk is simply a matter of giving the correct command. This command is always given in the article accompanying the program listings.

Technical Support

If you run into a problem with a *Nibble*

program that you can't solve, send your questions and a SASE to the Nibble Technical Support Department at 52 Domino Dr., Concord, MA 01742. Phone support is available on the Tech Support line from Monday through Friday between 2 and 5 PM EST at (508) 371-1669.

Nibble Hotline

If you have a 300- or 1200-baud modem, you can reach our Nibble Hotline at (508) 369-8920. The latest errata are listed, and you can download one-liners or order Nibble/Mindcraft software. The parameters are 8 data bits, 1 stop bit, no parity, full duplex.

ONE - AND TWO - LINERS

by Rudy Guy

Send In Your Entries!!!!

The One-Liner and Two-Liner Contests are ongoing events with several winners chosen every month! If you're one of the lucky winners, you can choose your favorite Nibble disk as your prize... just for having fun on your own. All you need to do is create the most interesting, attractive, useful, and/or clever program that can be typed using just one or two program lines.

Several months ago, MICRO.T.V., by Bill Currie from Mordialloc, Victoria, Australia, won this contest. After reviewing his entry, I wondered, *Does Bill live in the outback or has he watched too many Australian Rules football games?* The question was answered when Bill submitted his latest winning entry, PYRAMID. Bill writes that Mordialloc is a suburb of Melbourne. As for the football, the Hawthorn Hawks have won the 1989 Premier-ship and Bill is once again at his Apple, programming up a storm.

Run the program and watch as the slaves cut, transport, and lay the stones to create the Great Pyramid. The approximate date is printed during the construction and the site office is drawn on completion. Would you believe that the contractor is the Tutankhamon Construction Company? PYRAMID runs with DOS 3.3 or ProDOS and will work on any Apple II capable of displaying MouseText.

```

TOTAL: 7E04

Another Australian, John Pye from Barnawartha, is in the spotlight this month with his entry MENU.MAKER. This subroutine lets you create menus that can be called with a GOSUB 100 command from any part of a larger program. The subroutine requires the following variables be defined before it is used.

TS: This is the title of the menu. It can be as long as 39 characters.

C: This is the number of options in the menu. The maximum is 8.

C\$(1 to C): This array contains the names of the options in the menu. Options should be less than 30 characters long.

To better illustrate the use of these variables, add these lines to the beginning of John's subroutine

```
10 TS = "DEMO MENU": C = 3:
  CS(1) = "QUIT": CS(2) =
  "RETRY": CS(3) = "BEEP": GOSUB
  100: IF S = 1 THEN END
  20 IF S = 2 THEN GOTO 10
  30 IF S = 3 THEN PRINT CHR$(7):
  GOTO 10
```

John will receive the Nibble disk Window Works for his effort.

```
03 100 HOME : INVERSE : PRINT
    TAB( 20 - LEN (TS) / 2

Typing These Programs ★ ★ ★ ★ ★ The Ground Rules ★ ★ ★ ★ ★

Here are a few tips for typing in one-liners and two-liners. Be sure to omit spaces when typing in Applesoft programs, unless the spaces appear in strings between quotes, or in REM or DATA statements. You'll find it easier (and often essential) to substitute the question mark (?) for the PRINT statement. And when typing in machine language programs, it's safe to type in just the second digit of a hexadecimal pair if the first digit is a zero, e.g., the hex pair 03 can be typed in simply as 3. For more information on typing in programs, see the Typing Tips section.

Your programs must be your own, original work and may be written in Applesoft or machine language. You must be able to enter your program directly from the keyboard, without using a programming aid or line editor. Programs must be submitted on disk, accompanied by an 8.5- x 11-inch sheet of paper with your name, address, Nibble disk choice, program instructions and the words "One-Liner Contest" or "Two-Liner Contest."

Send your entries to Nibble, 52 Domino Dr., Concord, MA 01742. Entries become the property of MindCraft Publishing Corp.

modification to the motherboard, and constitutes the difference between the revision "A" and "B" motherboards on the Apple IIe. If Double Hi-Res programs don't display graphics properly on your Apple IIe, and you know you've got 128K, you might have the revision "A" board (although these are very rare). It is my understanding that Apple dealers will still upgrade old revision "A" boards at no charge.

So, if Applesoft doesn't know about the extra 64K of memory, how are 80-column text and Double Hi-Res achieved? In Applesoft, when you execute the PR#3 statement to turn on the 80-column card, you activate some additional assembly-language routines on the 80-column card that handle the auxiliary bank of memory to produce 80 columns while in your Applesoft program. Double Hi-Res is a little trickier. There are no built-in routines anywhere in the computer. To create a DHR image, assembly-language routines must be loaded into memory to draw to both banks in a coordinated way. Past issues of *Nibble* contain articles on this.

But what if you just want to load a DHR image you've downloaded from an on-line service, or created with a DHR paint program such as 816/Paint or Dazzle Draw? This is fairly simple.

To make it easier for 65C02 assembly-language routines to use the auxiliary bank (remember, the 65C02 can't access the auxiliary bank directly either), you can use some softswitch locations that will make the auxiliary bank of memory appear to be in bank 1. That is, any POKE, PEEK, CALL, or assembly-language instruction like LDA or STA can be made to use the auxiliary bank, even though the instruction is being executed in the main bank. This can get tricky (like sawing off the tree limb on which you're sitting), but if you're careful, you can load and save DHR pictures with simple BASIC commands.

The key is re-assigning the softswitches that usually toggle the display of pages 1 and 2 of text and graphics — locations \$C054 and \$C055. Normally, when you POKE location \$C055 (49237 decimal), the screen displays page 2. This is how the HGR2 command works in Applesoft. For easy access to the auxiliary bank, Apple Computer engineers added two new softswitches, locations \$C000 and \$C001 (49152 and 49153 decimal) that can change the function of locations \$C054 and \$C055 so they control bank access rather than page display.

If you write to memory location \$C000 with a POKE (the value doesn't matter), \$C054 and \$C055 function as a page switch. But if you write to location \$C001, any subsequent access to location \$C055 will switch the auxiliary bank of memory from \$400 to \$7FF (the text display area) and from \$2000 to \$3FFF (the Hi-Res page display area) so that it appears to be in main memory. This lets 65C02 or BASIC routines use the auxiliary bank as if it were in the main bank.

So, to load or save a DHR picture from BASIC, all you have to do is load or save the half of the DHR image that is in main memory, then set the softswitches to address the auxiliary bank. Load or save the second part of the image. ProDOS makes this easy by letting you read or write part of a file from disk.

The new, DHR version of our BASIC program is Listing 1. The program requires ProDOS. Type it in and save it to a ProDOS disk with

SAVE DHR PROGRAM

In the first third of the program, the DHR image is loaded in two parts. The current standard for DHR image files is to store the auxiliary memory part of the picture in the first half of the file, and the main memory portion in the second half.

The program starting at line 240 is a brute-force routine to draw a line on the Double Hi-Res screen by POKEing a value (255) directly into memory. You'll notice that although there are 80 byte positions across the screen, there are only 40 addresses. This is because the auxiliary memory bank has the same address range. You might wonder about line 280. Since H is odd when this part

of the program is executed, the value 8744 + H/2 will have a fractional value. But the POKE function in Applesoft automatically ignores any fractional remainder, so this won't be a problem.

These lines show how it is possible to draw to the DHR screen from BASIC, even though the task is usually conducted with assembly-language routines. (If you want to explore this further, review the Apple IIe or IIc technical reference manuals from Addison-Wesley. Also, I discuss DHR graphics in *Assembly Lines: The Book*, Volume II.)

The third part of this program saves the modified DHR screen back to disk by reversing the BLOAD procedure.

Don't be discouraged by the apparent complexity of this subject. If all you want to do is load a fancy title screen or picture for your own programs, just copy the first third of the example program into your listing; don't worry about the way it works.

POW!

ZAP!

Pow! printout

If you marvel at the thought of being the Stan Lee or Jack Kirby of the 1990s, but don't have the knack with a pen and brush, then **Pow! Zap! Ker-plunk!** by Pelican Software is right up your Apple II alley.

Creating a comic strip involves visual and intellectual planning, much like the scripting of a play. This program makes it easy to express yourself in a mode that demands a lot of creativity. And it's a great way to put words into someone's mouth without having them scream back at you!

To create your own dynamic cast, you can choose from dozens of heroines, monsters, musclemen, city dudes, and other characters on the clip-art disks supplied with the copy-protected program.

Pow! Zap! Ker-plunk! provides a screen of work space for each panel of your strip. You can load one of eight files to create the best background for your adventure. There are four backgrounds per file; you scan through them by pressing the Space bar. Press Return when you like what you see. What could be easier?

The same interface is used throughout the program.

After your background is established, you load character files until you find an appropriate creature or person for your idea. And you can add supporting characters and special effects — arms climbing out of the pavement, worms, little flying monsters, globbs, wands, dogs, cats, birds, and so on.

Next, give your characters speech balloons, or bubbles as they are called in the program, and enter the text of their "lines." If you have an Echo or Cricket speech synthesizer, you can hear them speak. Finally, type in the necessary narrative elements — "Meanwhile, back on Main Street" — in a text box. (Text boxes, like the other objects in this program, can be moved around the screen with the cursor keys or a mouse. But once you place an object, you can't move it again.)

For a finishing touch, you can enter a full page of Hi-Res text in one of four fonts.

When you're finished with a panel, save it to disk. You can print panels at any size, from actual comic strip scale to poster size. Also, you can print panels singly or arrange several on a comic book page; four layouts are provided.

Pow! Zap! Ker-plunk!, costs \$49.95, or \$59.95 for the school version; an additional graphics disk is \$19.95. The program requires an Apple IIe, IIc, or IIGS; supports dozens of printers and interface cards; and comes on 3.5-inch and 5.25-inch disks. Documentation includes a 45-page illustrated instruction manual and a booklet describing the contents of each graphic file. Pow! Zap! Ker-plunk is compatible with graphics from Learning Lab Software Publishing Co. programs: Monsters and Make Believe, Dinosaur Days, and Robot Writer. To order, contact Pelican Software Inc., 21000 Nordhoff St., Chatsworth, CA, 91311; 800-247-4641 or 800-222-7026 in California.

KER-PLUNK!

Quicken automatically updates your check register, recalculates balances, and prints your checks.

Quicken is easy because it looks like your paper checkbook, plus it faithfully follows the AppleWorks user interface.

Quicken can export to AppleWorks for custom reports: Budget vs. Actual, Income and Expenses, P&Ls, and more.

Quicken gives instant financial organization of:

- Spending
- Taxable Income and Deductions
- Rental Property and Job Costs.

Quicken eliminates work. It actually writes recurring checks without typing.

Dramatic Speed on Apple® IIGS

End Financial Hassles. Quicken®, \$59.95

Quicken is the absolute fastest, easiest way to do your personal or small business finances. Quicken saves you hours of time while perfectly organizing your finances.

Forget Financial Hassle

Quicken is so automatic, it does your financial work for you. It actually learns your regular bills. Just confirm the payment amounts on your auto loan, utilities, or other bills. Quicken does 14 automatic bookkeeping steps and hands you the printed checks already addressed for mailing. All you do is sign them and seal the envelopes. Quicken keeps complete records of your finances so you know exactly how much money you have and where it's going.

Finish Financial Work in Seconds

Instead of dreading tax time, use Quicken to print itemized lists supporting each tax deduction. Quicken is extremely fast. It does in seconds what used to take many minutes or even hours. Want the year's spending for Job 104 or Account 3072? The answers are just seconds away.

No Accounting Mumbo Jumbo

Quicken is as easy as the pen and paper you use now. You'll see the familiar checkbook and check register right on your screen. The only thing that changes is how fast you finish your financial chores. This is bookkeeping that's totally hassle-free.

The World's #1 Selling Financial Software

Here's why Quicken is the world's most popular:

Thanks to Quicken, I'm automating my personal checking account. I've never seen such an easy-to-use manual or software that's so simple to use.

Martin Blumenthal, *inCider Magazine*

With the power of AppleWorks so readily available, it's more than good...it's indispensable. Home and small business checking software used to be too expensive, too hard to use, and too rigid, and it took too long. Quicken has changed all that.

Ken Landis, *A+ Magazine*

Use Alone or with AppleWorks®

Quicken transfers your data directly to AppleWorks to create customized reports and spreadsheets. That means you can see your finances any way you like.

Flexible for Personal or Business Use

No other financial software provides more flexibility to handle the wide range of personal or business needs, from personal tax record-keeping to property management. With unlimited income and expense categories, Quicken keeps track of spending by whatever categories you desire.

Quicken works for service and manufacturing businesses, doctors, consultants, designers, and retailers. Quicken is for anyone who wants relief from bookkeeping hassles.

Try Quicken FREE for 30 Days

Let Your Child Play With A Power Tool.

This is one power tool you'll be glad to put in your children's hands. While other kids compete for time on school computers, the LASER 128® enables yours to get ahead at home.

And what an advantage they get. The LASER 128 is Apple®-compatible, so your children gain access to the world's largest library of educational software. Plus thousands of other programs.

The LASER 128 puts you ahead, too. It sells for nearly a third less than an Apple with fewer features.

With savings like that, you can buy a monitor and a printer for a complete setup. And teach your child a

valuable lesson in getting more for your money.

How good of a computer will you get? Let's put it this way. The leading Apple magazine, *InCider*, suggests you "look at today's LASER if you want to see tomorrow's Apple."

Follow their advice. Call 312/540-8911 (in Canada 416/477-2818) for your nearest dealer. Or write LASER Computer, Inc., 550 E. Main Street, Lake Zurich, IL 60047.

Then let your children play with a real power tool. That is, when you're finished using it.
